Access2010 2012-10-25 to anyone who is interested in surface chemical analysis of materials on the nanometer scale this book is prepared to give appropriate information based on typical application examples in materials science a concise approach to all aspects of quantitative analysis of surfaces and thin films with aes and xps is provided starting from basic principles which are step by step developed into practically useful equations extensive guidance is given to graduate students as well as to experienced researchers key chapters are those on quantitative surface analysis and on quantitative depth profiling including recent developments in topics such as surface excitation parameter and backscattering correction factor basic relations are derived for emission and excitation angle dependencies in the analysis of bulk material and of fractional nano layer structures and for both smooth and rough surfaces it is shown how to optimize the analytical strategy signal to noise ratio certainty and detection limit worked examples for quantification of alloys and of layer structures in practical cases e g contamination evaporation segregation and oxidation are used to critically review different approaches to quantification with respect to average matrix correction factors and matrix relative sensitivity factors state of the art issues in quantitative destructive and non destructive depth profiling are discussed with emphasis on sputter depth profiling and on angle resolved xps and aes taking into account preferential sputtering and electron backscattering corrections an introduction to the mixing roughness information depth mri model and its extensions is presented
