dr lands expertly explains how curative treatment interventions have unsuccessfully prevented diseases by ignoring the initial dietary causes of disease and death with years of clinical and dietary expertise he uses clear examples and current data to demonstrate how a moderate balanced diet is the key to long term good health this edition includes an expanded glossary of

words and concepts to help readers recognize how specific nutrient imbalances in our normal diets can contribute to disease and death also new to this edition are dietary tables showing the link between diet choices and the levels of healthy omega 3 in the body as dr lands eloquently states curiosity is the beginning of understanding and a steady pursuit of our questions seems to always lead us into new adventures and new understandings the second edition of fish omega 3 and human health reaffirms that the essential fatty acids in the foods we eat form hormones that have powerful effects on human life while many find it hard to believe that a simple change of diet can affect so many aspects of their lives this book aims to shift prevailing attitudes about the relationship between foods and disease

the evidence that omega 3 fatty acids are essential for human development and most helpful to achieve good health throughout life is clearly documented by dr joyce nettleton in her new book omega 3 fatty acids and health omega 3 fatty acids are produced by the plants of the land and sea the tissues of the body require the omega 3 fatty acids for their proper functioning just as they also need the omega 6 essential fatty acids it is probable in man s evolutionary development that there has always been the proper balance between these two groups of essential fatty acids but in the modern era with the provision of inexpensive vegetable oils it is possible that the pendulum for increased dietary omega 6 fatty acids in the form of linoleic acid has swung too far and the intake of omega 3 fatty acids has actually declined in particular the 22 carbon omega 3 fatty acid docosahexaenoic acid which has six double bonds is important in the membranes of brain cells heart muscle cells the rods and cones of the retina and spermatozoa docosahexaenoic acid is found only in foods such as fish and other sea life having been synthesized by the phytoplankton of the waters an outright deficiency of omega 3 fatty acids has led to a number of disturbances in animals and human infants such as impaired vision abnormalities of the electroretinogram of the eye and various behavioral aberrations
