let r be a polynomial ring over an algebraically closed field and let a be a standard graded cohen macaulay quotient of r the authors state that a is a level algebra if the last module in the minimal free resolution of a as r module is of the form r s a where s and a are positive integers when a 1 these are also known as gorenstein algebras the basic question addressed in this paper is what can be the hilbert function of a level algebra the authors consider the question in several particular cases e g when a is an artinian algebra or when a is the homogeneous coordinate ring of a reduced set of points or when a satisfies the weak lefschetz property the authors give new methods for showing that certain functions are not possible as the hilbert function of a level algebra and also give new methods to construct level algebras in a rather long appendix the authors apply their results to give complete lists of all possible hilbert functions in the case that the codimension of a 3 s is small and a takes on certain fixed values

in recent years there has been a large amount of work on invariant subspaces motivated by interest in the structure of non self adjoint of the results have been obtained in operators on hilbert space some the context of certain general studies the theory of the characteristic operator function initiated by livsic the study of triangular models by brodskii and co workers and the unitary dilation theory of sz nagy and foia other theorems have proofs and interest independent of any particular structure theory since the leading workers in each of the structure theories have written excellent expositions of their work cf sz nagy foia 1 brodskii 1 and gohberg krein 1 2 in this book we have concentrated on results independent of these theories we hope that we have given a reasonably complete survey of such results and suggest that readers consult the above references for additional information the table of contents indicates the material covered we have restricted ourselves to operators on separable hilbert space in spite of the fact that most of the theorems are valid in all hilbert spaces and many hold in banach spaces as well we felt that this restriction was sensible since it eases the exposition and since

the separable hilbert space case of each of the theorems is generally the most interesting and potentially the most useful case
