this book highlights the mechanics of tire performance offering detailed explanations of deriving basic equations for the fundamental properties of tires and discussing ways to improve tire performance using these equations it also compares the theory with practical measurements the book commences with composite mechanics which is the fundamental theory for belt and carcass tires and covers classical modified and discrete lamination theory it then addresses the theory of tire shape and spring properties and the mechanics of tread pattern contact properties as was well as the performance of various tires this comprehensive book is a valuable resource for engineers involved in tire design and offers unique insights and examples of improvement of tire performances

this book explores the internet and mobile ecosystems which are powered by cloud computing an essential if not indispensable part of our everyday lives billions of users world wide use this technology for information sharing communication and social networking and a high proportion of activity is driven by massive media content such as images videos and other emerging 3d visual media however managing searching and visualizing this gigantic amount of data to facilitate communication is difficult which has led to an influx of innovation and research in these areas the research is from academics from all around the world focusing on the intersection of mobile cloud visual and multimedia computing and is split into five clear

parts topics covered in the book include mobile augmented reality computational photography mobile visual recognition and search and human computer interaction hci the findings discussed is meant to spur on further creative development in both academia and industry within this area mobile cloud visual media computing would of great interest to researchers and academics wishing to see how the state of the art in media computing research is applied to innovative applications whilst engineers and software designers from industry will gain an insight into the key set of technologies which support mobile and cloud media computing

this book addresses the challenges of data abstraction generation using a least number of database scans compressing data through novel lossy and non lossy schemes and carrying out clustering and classification directly in the compressed domain schemes are presented which are shown to be efficient both in terms of space and time while simultaneously providing the same or better classification accuracy features describes a non lossy compression scheme based on run length encoding of patterns with binary valued features proposes a lossy compression scheme that recognizes a pattern as a sequence of features and identifying subsequences examines whether the identification of prototypes and features can be achieved simultaneously through lossy compression and efficient clustering discusses ways to make use of domain knowledge in generating abstraction reviews optimal prototype selection using genetic algorithms suggests possible ways of dealing with big data problems using multiagent systems
