what is functional programming there are three types of programming that you may or may not know procedural programming object oriented programming and functional programming i ll focus on the latter two in object oriented programming oop you create objects hence the name which are structures that have data and methods what is functional programming functional programming is a programming paradigm a style of building the structure and elements of computer programs that treats computation as the evaluation of mathematical functions and avoids changing state and mutable data wikipedia in computer science functional programming is a programming paradigm where programs are constructed by applying and composing functions so what is a functional programming language they are specific programming languages built around the ideas behind functional programming paradigms a few examples include haskell scala clojure f and more we ll cover seven of the best functional programming languages in this article in this post i will lay down the major principles of functional programming starting with the basics and then exploring more advanced concepts i ll first talk about why you should bother with functional programming that is when it s useful and when it s not functional programming means using functions to the best effect for creating clean and maintainable software this article illustrates the concepts behind the functional paradigm with practical functional programming is a declarative programming paradigm where programs are created by applying sequential functions rather than statements each function takes in an input value and returns a consistent output value without altering or being affected by the program state functional programming decomposes a problem into a set of functions ideally functions only take inputs and produce outputs and don t have any internal state that affects the output produced for a given input 1 introduction in this article we ll discuss functional programming we ll define its foundations and principles and then we ll compare functional programming with oop lastly we ll introduce a few popular functional programming languages 2 programming paradigms choose the functional programming course that aligns best with your educational goals École polytechnique fédérale de lausanne functional programming in scala functional programming is a sub paradigm of the declarative programming paradigm with its own rules to follow when writing code what is the declarative programming paradigm if you re coding in a language that follows the declarative paradigm you write code that specifies what you want to do without saying how in this tutorial we ll understand the functional programming paradigm s core principles and how to practice them in the java programming language we ll also cover some of the advanced functional programming techniques functional programming fp is an approach to software development that uses pure functions to create maintainable software in other words building programs by applying and composing functions functional programming is a programming paradigm in which we try to bind everything in pure mathematical functions style it is a declarative type of programming style its main focus is on what to solve in contrast to an imperative style where the main focus is how to solve in this tutorial you ll learn about functional programming in python you ll see what functional programming is how it s supported in python and how you can use it in your python code functional programming also called fp is a way of thinking about software construction by creating pure functions it avoid concepts of shared state mutable data observed in object oriented programming functional langauges empazies on expressions and declarations rather than execution of statements functional programming fp and object oriented programming oop are two different programming paradigms that is a way of thinking about writing software based around certain principles a paradigm is a set of programming habits that constrain you in some way 17 answers sorted by 187 a functional language ideally allows you to write a mathematical function i e a function that takes n arguments and returns a value if the program is executed this function is logically evaluated as needed 1 a procedural language on the other hand performs a series of sequential steps in this piece we ll review the major differences between functional and object oriented programming offer up a few examples of how they work and review the considerations that matter most when making the choice between these coding paradigms functional programming is centered around building software composed of functions similar to procedural programming however there are subtle differences we highlight these differences by discussing key concepts of functional programming below first class citizens functions are treated as primitives
