Practical Assessment and Treatment of the Patient with Headaches in the Emergency Department and Urgent Care Clinic 2011-07-29

migraine is an extremely common condition affecting 28
million americans fully 1 in every 6 adult women
suffers from this malady patients with migraine are
frequently seen in the emergency room and urgent care
clinic for acute treatment of their headaches headache
generally accounts for nearly 3 of all er visits
resulting in almost 3 5 million visits annually there
currently are no widely used guidelines for the
treatment of patients with headache in the er or ucc
and reducing the number of ct scans remains a key goal
for administrators in many er or urgent care settings
in one study 35 drugs alone or in combination were used
to treat migraine the most common medication class used
was narcotics which were used in 25 of the visits the
next two most commonly used classes were antiemetics
and nsaids only 5 of patients seen for headache
received headache specific medications during their

visit er and urgent care physicians generally have little or no formal training in treating these patients consequently they often feel less comfortable ruling out secondary causes of headaches and using appropriate headache treatment medications and procedures since many patients have received narcotics in previous visits providers may view them as drug seekers patients seen in ers and uccs for acute treatment of their headaches often report high levels of dissatisfaction they often end up in the er or ucc because they don't have a formal treatment strategy for their severe headaches health plans and insurance agencies are often frustrated by the high cost of fragmented care for patients with headaches because of the environment that most er and ucc providers operate in many unnecessary scans and tests are done because of uncertainty of the diagnosis and unfamiliarity of the patient primary care physicians are also frustrated by patients with headaches presenting to them after being seen in the er or ucc wanting a refill of their narcotics that they were given many patients don't follow up with their pcps and simply keep returning to the er ucc for their treatment in short all involved in the care for patients with headache are frustrated by the current system the care for these patients is clearly not optimal it doesn't have to be that way there are a wide variety of effective treatment options available but are underutilized in the acute setting with these treatment options patients no longer have to be treated only with parenteral narcotics only to perpetuate the cycle of suboptimal care described above this concise handbook covers all aspects of acute headache care including care of the child and adolescent with acute headaches treatment of pregnant and breastfeeding women with acute headaches and appropriate evaluation of secondary headaches in addition two other novel chapters are included one on caring for older patients with acute headaches as well as a chapter describing how to ensure a seamless transition of the patient back to a headache interested provider representing an important milestone in the care of patients with headache this is the first concise handbook available to exclusively address the issue of headache treatment in the acute care setting including protocols and

strategies that can be used right away management of headaches in emergency room and urgent care settings diagnosis and management provides information about lesser known but effective strategies such as greater occipital nerve blocks that can be easily learned and incorporated in the acute care setting it emphasizes the continuity of care that is so vital to keep headache patients from returning to the er and ucc for acute treatment

Updating in Headache 2008-09-01

in september 1983 the first international headache congress took place the founding congress of the international headache society lhs this meeting was attended by around 200 headache specialists from some 20 countries one of the principal goals of the ihs which was formed in london in 1982 is to promote and stimulate interest and research in the headache field in addition to the sponsorship of continued education events this also involves the coordination of scientific projects and the organization of future conferences there is no doubt that headaches represent an everyday problem in medical practice when the first headache clinics were established some years ago they were regarded as very progressive today there are special outpatient centers and clinics for headache patients however this specialization has certainly not progressed very far the fact is that differential diagnosis and treatment of recurrent and chronic headaches represents a broad field that cuts across many disciplines headaches are thus relevant not only to the neurologist but also to the psychiatrist the neurosurgeon the internist the endocrinologist the psychologist the pharmacologist and the biochemist despite intensive research in numerous and very disparate medical disciplines there are still no generally accepted pathophysiologic concepts for many headache syndromes realizing the importance of a multidisciplinary forum the ihs assumed the

Clinical and Pathophysiological Peculiarities of Headache in Children and Adolescents 2008-08-21

migraine treatment improved considerably with the advent of the triptans in the 1990s while the drugs used previously for headache treatment had efficacy some compounds had bothersome side effects and their overuse could lead to severe complications in the early days of the triptans it was widely presumed that migraine was no longer a treatment problem however it has gradually been recognized that a significant proportion of patients are not responsive to triptans or do not tolerate them it is now clear that even with effective treatment patients with frequent migraine attacks are not treated well exclusively with acute medications this is partly because patients are still bothered by the attacks and partly because frequent intake of acute medication may result in medication overuse headache these problems have led to a renewed interest in preventive migraine drugs part of the frontiers in headache research series this book summarizes the several promising new avenues for the development of future drugs for the treatment of migraine including cortical spreading depression inhibition nitric oxide synthase inhibition and

calcitonin gene related peptide cgrp receptor antagonism as well as other potential targets the book presents frontline knowledge of these evolving modalities as far as it is available in the public domain it is hoped that readers and their patients will find it exciting to learn about all the novel possibilities and also that the impressive research advances in migraine will lead to increased funding not only of migraine but also of other types of headache
