synergic influence of gaseous particulate and biological pollutants on human health is a unique merger of two divergent parts the first part is a presentation of the existing knowledge on the characteristics of basic air pollutants and their documented impact on human health the focus is on the main gaseous airborne particles including fiber particles and biological pollutants the first part is a literature review conducted by the authors who are actively engaged in studying the described pollutants the second part contains a study of methods used for the evaluation and prognosis of health effects to exposure to particular pollutants most of the chapters of this book go beyond the well documented solid facts and contain the authors own evaluation of the utility and limitations of particular methods as well as their suggestions for further studies the reader who manages to wade through this part is sure to understand that the main drawback of the described methods is the impossibility to precisely assess the health effects of exposure to the combination of a few many air pollutants while one of the biggest problems is the effect of synergy the last chapters of the book focus on the attempts to consider the effect of synergy and the analysis of the tedious work of many researchers to construct the tools enabling to some extent the prognosis of the health effects of simultaneous exposure to many air pollutants the book also reveals the synergism of pollutants and social problems reinforcing the adverse health effect of the population living not only in highly industrialized areas but also in postindustrial areas according to the authors the construction of suitable tools which would at least partially allow for the evaluation of the collective impact of social factors and the conglomerate of the air pollutants on health of particular communities constitutes a great challenge and may inspire the readers to think deeply on this subject this book is an invaluable volume for air protection professionals and phd students environmental engineers environmental health researchers and public health policy makers

characterized by its multi level interdisciplinary character communication has become a variable field one in which the level of analysis varies this has had important ramifications for the study of communication because to some extent the questions one asks are determined by the methods one has available to answer them as a result communication research is characterized by the plethora of both qualitative and quantitative approaches used by its practitioners these include survey and experimental methods and content historical and rhetorical analyses a variety of tools has been developed in cognitive psychology and psychophysiology which attempts to measure thinking without asking people how they do it this book is devoted to exploring how these methods might be used to further knowledge about the process of communication the methods chosen have all been used extensively in cognitive and experimental psychology each chapter in this book is designed to describe the history of the method being introduced the theory behind it how to go about using it and how it has already been used to study some area of communication the methods introduced here vary widely in terms of the amount of equipment and training needed to use them some require only theoretical knowledge and a paper and pencil others require more elaborate hardware and software for implementation these methods also vary widely in terms of what

sorts of variables they can be used to measure some of them adapt quite readily to traditional communication variables like persuasion attitude change and knowledge others are more applicable to process type variables such as attention arousal involvement encoding and retrieval
