questionnaires are widely used in the social sciences and very often survey data form the basis for governmental and commercial planning or evaluation yet the quality of survey data is not attested to since a large variety of factors in the language use situation prove to influence the answers unintentionally the forbid allow asymmetry is a well known example of this when respondents are asked whether something should be forbidden about 50 may answer yes forbid whereas an equivalent question phrased with the verb to allow could well cause up to 75 of the respondents to answer no it should not be allowed which question wording is preferable to measure respondents true attitudes only when we know why the answers differ can we decide on that this book is the first to apply a systematic cognitive approach to describe the causes of the forbid allow asymmetry the question answering process is unravelled by a variety of experiments and meta analytic techniques analyses reveal that the difference in question wording does not prompt respondents to retrieve different attitudes instead the asymmetry reflects that the question wording causes the response options to be used differently because of the qualifying dimensions in the question text the meanings of yes and no change as well as the cognitive distance between them this study sheds a different light on processes of question answering and text interpretation furthermore practical advice on questionnaire design and on the interpretation of survey data is given on the basis of these new insights

educart class 12 chemistry question bank combines remarkable features for term 2 board exam preparation exclusively developed based on learning outcomes and competency based education pattern this one book includes chapter wise theory for learning solved questions from ncert and diksha and detailed explanations for concept clearance and unsolved self practice questions for practice topper s answers are also given to depict how to answer questions according to the cbse marking scheme solutions

Questions and Information Systems

the design and functioning of an information system improve to the extent that the system can handle the questions people ask surprisingly however researchers in the cognitive computer and information sciences have not thoroughly examined the multitude of relationships between information systems and questions both question asking and answering the purpose of this book is to explicitly examine these relationships chapter contributors believe that questions play a central role in the analysis design and use of different kinds of natural or artificial information systems such as human cognition social interaction communication networks and intelligent tutoring systems their efforts show that data structures and representations need to be organized around the questioning mechanisms in order to achieve a quick retrieval of relevant useful information

experiment design for civil engineering provides guidance to students and practicing civil engineers on how to design a civil engineering experiment that will produce useful and unassailable results it includes a long list of complete experiment designs that students can perform in the laboratory at most universities and that many consulting engineers can do in corporate laboratories these experiments also provide a way to evaluate a new design against an existing experiment to determine what information is most appropriate in each section and how to format the data for the most effective outcome interpretation of output data is discussed along with uncertainty as well as optimal presentation of the data to others the content of the first 8 chapters is similar in format to authors recent title experiment design for environmental engineering methods and examples crc press 2022 and has been revised for civil engineers this textbook fills in the gap in abet requirements to teach experiment design provides a standardized approach to experiment design that can work for any experiment includes completed experiment designs suitable for college laboratory and professional applications shows how to organize experimental data as it is collected to optimize usefulness provides templates for design of the experiment and for presenting the resulting data to technical and nontechnical audiences or clients

this book offers a novel analysis of the widely used but ill understood technique of thought experiment the author
argues that the powers and limits of this methodology can be traced to the fact that when the contemplation of an
imaginary scenario brings us to new knowledge it does so by forcing us to make sense of exceptional cases

this book deals with contemporary epistemological questions connecting educational philosophy with the field of
science and technology studies it can be understood as a draft of a general theory of world disclosure which is in its
core a distinction between two forms of world disclosure experiment and exploration these two forms have never
been clearly distinguished before the focus lies on the experimental form of world disclosure which is described in
detail and in contrast to the explorational form along the line of twenty one characteristics which are mainly derived
from empirical studies of experimental work in the field of natural sciences it can also be understood as an attempt
to integrate elements of the anglo saxon philosophy of science with elements of the german tradition of educational
philosophy this is also reflected in the style of writing in accordance to the content level of the book the argument
for experimental forms of world disclosure is written in an essayistic readable style which can be understood as an
experimental form of writing this book is a translation of the doctoral thesis experiment und exploration bildung als
experimentelle form der welterschließung summa cum laude the thesis was published in german in 2010 by
transcript bielefeld in the series called theorie bilden edited by prof dr hannelore faulstich wieland prof dr hans

the topic addressed in this volume lies within the study of sentence processing which is one of the major divisions
of psycholinguistics the goal has been to understand the structure and functioning of the mental mechanisms

involved in sentence comprehension most of the experimental and theoretical work during the last twenty or thirty years has focused on first pass parsing the process of assigning structure to a sentence as its words are encountered one at a time from left to right one important guiding idea has been to delineate the processing mechanisms by studying where they fail for this purpose we identify types of sentences which perceivers have trouble assigning structure to an important class of perceptually difficult sentences are those which contain temporary ambiguities since the parsing mechanism cannot tell what the intended structure is it may make an incorrect guess then later on in the sentence the structure assignment process breaks down because the later words do not fit with the incorrect structural analysis this is called a garden path situation when it occurs the parsing mechanism must somehow correct itself and find a different analysis which is compatible with the incoming words this reanalysis process is the subject of the research reported here

many of our thoughts and decisions occur without us being conscious of them taking place connectionism attempts to reveal the internal hidden dynamics that drive the thoughts and actions of both individuals and groups connectionist modeling is a radically innovative approach to theorising in psychology and more recently in the field of social psychology the connectionist perspective interprets human cognition as a dynamic and adaptive system that learns from its own direct experiences or through indirect communication from others social connectionism offers an overview of the most recent theoretical developments of connectionist models in social psychology the volume is divided into four sections beginning with an introduction and overview of social connectionism this is followed by chapters on causal attribution person and group impression formation and attitudes each chapter is followed by simulation exercises that can be carried out using the fit simulation program these guided exercises allow the reader to reproduce published results social connectionism will be invaluable to graduate students and researchers primarily in the field of social psychology but also in cognitive psychology and connectionist modeling

gender inequality remains an issue of high relevance and controversy in society previous research shows that language contributes to gender inequality in various ways gender related information is transmitted through formal and semantic features of language such as the grammatical category of gender through gender related connotations of role names e.g. manager secretary and through customs of denoting social groups with derogatory vs neutral names both as a formal system and as a means of communication language passively reflects culture specific social conditions in active use it can also be used to express and potentially perpetuate those conditions the questions addressed in the contributions to this frontiers special topic include how languages shape the cognitive representations of gender how features of languages correspond with gender equality in different societies how language contributes to social behaviour towards the sexes how gender equality can be promoted through strategies for gender fair language use these questions are explored both developmentally across the life span from childhood to old age and in adults the contributions present work conducted across a wide range of

languages including some studies that make cross linguistic comparisons among the contributors are both cognitive and social psychologists and linguists all with an excellent research standing the studies employ a wide range of empirical methods from surveys to electro physiology the papers in the special topic present a wide range of complimentary studies which will make a substantial contribution to understanding in this important area

what is combinatorics anyway broadly speaking combinatorics is the branch of mathematics dealing with different ways of selecting objects from a set or arranging objects it tries to answer two major kinds of questions namely counting questions how many ways can a selection or arrangement be chosen with a particular set of properties and structural questions does there exist a selection or arrangement of objects with a particular set of properties the authors have presented a text for students at all levels of preparation for some this will be the first course where the students see several real proofs others will have a good background in linear algebra will have completed the calculus stream and will have started abstract algebra the text starts by briefly discussing several examples of typical combinatorial problems to give the reader a better idea of what the subject covers the next chapters explore enumerative ideas and also probability it then moves on to enumerative functions and the relations between them and generating functions and recurrences important families of functions or numbers and then theorems are presented brief introductions to computer algebra and group theory come next structures of particular interest in combinatorics posets graphs codes latin squares and experimental designs follow the authors conclude with further discussion of the interaction between linear algebra and combinatorics features two new chapters on probability and posets numerous new illustrations exercises and problems more examples on current technology use a thorough focus on accuracy three appendices sets induction and proof techniques vectors and matrices and biographies with historical notes flexible use of mapletm and mathematicatm

neutrinos continue to be the most mysterious and arguably the most fascinating particles of the standard model as their intrinsic properties such as absolute mass scale and cp properties are unknown the open question of the absolute neutrino mass scale will be addressed with unprecedented accuracy by the karlsruhe tritium neutrino katrin experiment currently under construction this thesis focusses on the spectrometer part of katrin and background processes therein various background sources such as small penning traps as well as nuclear decays from single radon atoms are fully characterized here for the first time most importantly however it was possible to reduce the background in the spectrometer by more than five orders of magnitude by eliminating penning traps and by developing a completely new background reduction method by stochastically heating trapped electrons using electron cyclotron resonance ecr the work beautifully demonstrates that the obstacles and challenges in measuring the absolute mass scale of neutrinos can be met successfully if novel experimental tools ecr and novel computing methods kassiopeia are combined to allow almost background free tritium β spectroscopy

there are currently several debates taking place simultaneously in various fields of psychology which address the same fundamental issue to what extent are the processes and resources that underlie higher cognition domain general versus domain specific extreme domain specificity argues that people are effective thinkers only in contexts which they have directly experienced or in which evolution has equipped them with effective solutions the role of general cognitive abilities is ignored or denied altogether this book evaluates the evidence and arguments put forward in support of domain specific cognition at the expense of domain generality the contributions reflect a range of expertise and present research into logical reasoning problem solving judgement and decision making cognitive development and intelligence the contributors suggest that domain general processes are essential and that domain specific processes cannot function without them rather than continuing to divide the mind s function into ever more specific units this book argues that psychologists should look for greater integration and for people s general cognitive skills to be viewed as an integral part of their lives integrating the mind will be valuable reading for students and researchers in psychology interested in the fields of cognition cognitive development intelligence and skilled behaviour

antonis botinis 1 1 background this introduction provides essential information about the structure and the objects of study of this volume following the introduction fourteen papers which represent current research on intonation are organised into five thematic sections i overview of intonation ii prominence and focus iii boundaries and discourse iv intonation modelling and v intonation technology within the sections the papers are arranged thematically although several papers which deal with various aspects of intonation and prosody are basically intersectional as the title indicates intonation analysis modelling and technology is a contribution to the study of prosody with major emphasis on intonation intonation and tonal themes are thus the central object of the volume although temporal and dynamic aspects are also taken into consideration by a good number of papers although tonal and prosodic distinctions have been dealt with throughout man s literate history with reference to the study of language for example by classical philosophers such as plato and aristotle it is in recent decades that we have witnessed the most fertile growth in intonation studies as with experimental phonetics and speech technology in general as rossi this volume points out intonation research really began to blossom in the sixties with a multi fold increase in prosodic studies reflected in contributions to the international congress of phonetic sciences icphs and in the international literature
