presidential rhetoric and indian policy explores and analyses the dynamics of presidential rhetoric on native peoples and issues from nixon to the present covering presidents washington through johnson in an overview before turning to focus on the modern era of self determination anne flaherty offers a systematic analysis of 700 presidential statements that mention native issues from 1969 through 2020 to evaluate whether presidents in the modern era have used their rhetorical platforms to bring attention to native issues and to support this coherent strategy of self determination flaherty provides evidence that rhetorical themes vary by administration and seem to either rely on more symbolic historical language or to connect more clearly to the dominant platforms and messages of the president in question the book then moves to incorporate an analysis of key outcomes compared across the administrations the data and analysis show that federal spending legislative outcomes and supreme court decisions have not consistently supported self determination policy over the past 50 years this book is a must read for scholars and students interested in indigenous politics native american indian politics us presidency and rhetoric

the rate of technological progress is encouraging increasingly sophisticated lines of enquiry in cognitive neuroscience and shows no sign of slowing down in the foreseeable future nevertheless it is unlikely that even the strongest advocates of the cognitive neuroscience approach would maintain that advances in cognitive theory have kept in step with methods based developments there are several candidate reasons for the failure of neuroimaging studies to convincingly resolve many of the most important theoretical debates in the literature for example a significant proportion of published functional magnetic resonance imaging fmri studies are not well grounded in cognitive theory and this represents a step away from the traditional approach in experimental psychology of methodically and systematically building on or chipping away at existing theoretical models using tried and tested methods unless the experimental study design is set up within a clearly defined theoretical framework any inferences that are drawn are unlikely to be accepted as anything other than speculative a second more fundamental issue is whether neuroimaging data alone can address how cognitive functions operate far more interesting to the cognitive scientist than establishing the neuroanatomical coordinates of a given function the where question
