combinatorics is one of most logical and live field of mathematics concepts of combinatorics are widely applicable in probability and computations learning combinatorics requires little different approach it requires building fundamental rules of execution every new problem demands a new rule this book is a perfect match for beginners and focuses on experiential learning of the subject it takes reader into the all new world of the combinatorics while developing intuitive map of working algorithms this book is suitable as a class text or for individual study this trusted book covers the concepts of combinatorics including the counting techniques permutations and combinations arrangements of objects in circular manner derangement generating functions and recurrence relations this wonder book is also suitable for any one interested in learning combinatorics from scratch and having no basic knowledge concepts are presented in very lucid manner students will definitely find it very easy to read a wide range of solved examples about 300 combinatorics problems taken from various mathematical competitions and exercises are also included

the mathematics of counting permutations and combinations is required knowledge for probability statistics professional gambling and many other fields but counting is hard students find it hard teachers find it hard and in the end the only way to learn is to do many problems tim hill s learn by example approach presents counting concepts and problems of gradually increasing difficulty if you become lost or confused then you can back up a bit for clarification with practice you ll develop the ability to decompose complex problems and then assemble the partial solutions to arrive at the final answer the result learn in a few weeks what conventional schools stretch into months teaches general principles that can be applied to a wide variety of problems avoids the mindless and excessive routine computations that characterize conventional textbooks treats counting as a logically coherent discipline not as a disjointed collection of techniques restores proofs to their proper place to remove doubt convey insight and encourage precise logical thinking omits digressions excessive formalities and repetitive exercises provides exceptional preparation for probability and statistics courses includes problems with all solutions that extend your knowledge rather than merely reinforce it contents 1 the sum rule and product rule 2 permutations 3 combinations 4 the binomial theorem 5 combinations with repetition 6 summary and solutions about the author tim hill is a statistician living in boulder colorado he holds degrees in mathematics and statistics from stanford university and the university of colorado tim has written self teaching guides for algebra trigonometry geometry precalculus advanced precalculus permutations combinations mathematics of money and excel pivot tables when he s not crunching numbers tim climbs rocks hikes canyons and avoids malls

this chapter presents several classes of fusion problems which cannot be directly approached by the classical mathematical theory of evidence also known as dempster shafer theory dst either because shafer s model for the frame of discernment is impossible to obtain or just because dempster s rule of combination fails to provide coherent results or no result at all we present and discuss the potentiality of the dsmt combined with its classical or hybrid rule of combination to attack these infinite classes of fusion problems

the fourth conference on fibrous composites in structural design was a successor to the first to third conferences on fibrous composites in flight vehicle design sponsored by the air force first and second conferences september 1973 and may 1974 and by nasa third conference november 1975 which were aimed at focusing national attention on flight vehicle applications of a new class of fiber reinforced materials the advanced com posites which afforded weight savings and other advantages which had not been previously available the fourth conference held at san diego california 14 17 november 1978 was the fi rst of these conferences to be jointly sponsored by the army navy and ai r force together with nasa as well as being the first to give attention to non aerospace applications of fiber reinforced composites while the design technology for aerospace applications has reached a state of relative maturity other areas of application such as mi litary bridging

flywheel energy storage systems ship and surface vessel components and ground vehicle components are in an early stage of development flywheel and it was an important objective to pinpoint where careful attention to structural design was needed in such applications to achfeve maximum structural performance payoff together with a high level of reliability and attractive economics

this book has evolved from our deep interest and involvement in the development and application of reliability evaluation techniques its scope is not limited to anyone engineering discipline as the concepts and basic techniques for reliability evaluation have no disciplinary boundaries and are applicable in most if not all engineering applications we firmly believe that reliability evaluation is an important and integral feature of the planning design and operation of all engineering systems from the smallest and most simple to the largest and most complex also we believe that all engineers involved with such systems should be aware of and appreciate not only the benefits which can accrue from reliability assessment but also how such assessments can be made our primary objective has been to compile a book which provides practising engineers and engineering graduates who have little or no background in probability theory or statistics with the concepts and basic techniques for evaluating the reliability of engineering systems it is hoped that the material presented will enable them to reach quickly a level of self confidence which will permit them to assimilate understand and appreciate the more detailed applications and additional material which is available in the journals and publications associated with their own discipline

dynamic phonology is the natural consequence of the combination of the latest developments in physiological and acoustic phonetics and the traditional structural functional theories of linguistics in phonetics the segmental approach has long since given way to dynamic phonetics leaving linguists in the position of either ignoring the dynamic evidence and continuing with segmental and semi segmental phonology or of adopting the dynamic evidence within their overall theories of language structure and function the author of this book has chosen the latter and here present a model for such a dynamic phonology

this book examines the special nature of english both as a global and a local language focusing on some of the ongoing changes and on the emerging new structural and discoursal characteristics of varieties of english although it is widely recognised that processes of language change and contact bear affinities for example to processes observable in second language acquisition and lingua franca use the research into these fields has so far not been sufficiently brought into contact with each other the articles in this volume set out to combine all these perspectives in ways that give us a better understanding of the changing nature of english in the modern world

nappes and overthrusts are the mosl representative geological structures in mountain chains the issue of their emplacement mechanisms and of the driving force of these displacements is a major problem in tectonics which interests for near to a century now and not without harsh controversies a significant proportion of structural geologists and geoscientists who work in the field of rock mechanics this book attempts to give a clear and didactic synthesis of the current knowledge of the concept of thrusting principally by tackling two approaches mechanics and kinematics which have proposed some solutions to this problem at first chapter i the notions of thrusting are defined with the most recent terminology and the most important geometric aspects this introduction to the geometry of thrusts is logically followed by the presentation of their problem the issue of the emplacement mechanisms chapter 2 let us note in passing that the formulation of the concept and the presentation of its problem are associated historically which justifies presenting them in the historical framework of this discovery before tackling the different solutions and mechanical hypotheses these are detailed in chapter 3 by following a chronological progression and emphasising the divergences and oppositions between different models so as to cover them fully the chapter on the kinematics chapter 4 then returns to the type of data which can be collected in the field by clarifying the relationships between displacement and internal strain

nature inspired algorithms have been gaining much popularity in recent years due to the fact that many real world optimisation problems have become increasingly large complex and dynamic the size and complexity of the problems nowadays require the development of methods and solutions whose efficiency is measured by their ability to find acceptable results within a reasonable amount of time rather than an ability to guarantee the optimal solution this volume nature inspired algorithms for optimisation is a collection of the latest state of the art algorithms and important studies for tackling various kinds of optimisation problems it comprises 18 chapters including two introductory chapters which address the fundamental issues that have made optimisation problems difficult to solve and explain the rationale for seeking inspiration from nature the contributions stand out through their novelty and clarity of the algorithmic descriptions and analyses and lead the way to interesting and varied new applications
