heritage under pressure examines the relationship between the political perspective of the uk government on soft power and the globalising effect of projects carried out by archaeologists and heritage professionals working in the historic environment it exemplifies the nature of professional engagement and the role of the profession in working towards a theory of practice based on the integrity of data the recovery and communication of information and the application of data in real world situations individual papers raise complex and challenging issues such as commemoration identity and political intervention a further aim of the volume is to illustrate the role of professionals adhering to standards forged in the uk in the context of world heritage under pressure papers also contribute to the emerging agenda developing as a result of the re orientation of the uk following the brexit vote at once emphasising the global aspiration of the uk s professional archaeological body the chartered institute for archaeologists in relation to the global reach of uk academic practice by implication the volume also addresses the relationship between professional practice and academic endeavour the volume as a whole contributes to the emerging debate on the authorised heritage discourse and provides an agenda for the future of the profession

this manual contains solutions to most of the exercises in the book techniques of problem solving by steven g krantz it is essential that this manual be used only as a reference and never as a way to learn how to solve the exercises it is strongly encouraged never to look up the solution of any exercise before attempting to solve it the attempt time will always be as rewarding to the student or maybe more as solving the exercise itself

solution based casework is an approach to assessment case planning and case management that combines what we know from clinical social work with what we value about sound social work practice it is grounded in family centered social work and draws from clinical approaches within social work and mental health by integrating problem and solution focused approaches that form the clinical and social work traditions treatment partnerships are more easily formed between family caseworker and service provider solution based casework is a skill based practice oriented text that provides the specific guidance that students and new practitioners need in order to make sense quickly of the complex tasks of assessment and case planning in child welfare the book flows out of a long practice experience and was developed in consultation with workers and supervisors who were attempting to remedy problems viewed as contributing to recurrent abuse and neglect it seeks to end adversarial relationships in casework and advocates case plans based on specific outcome skills rather than on those written with vague outcome goals measuring attendance in counseling it serves as a common conceptual framework for integrating disparate segments of a response network thereby allowing all providers in a therapeutic system to work toward common goals the text is divided into three sections in section i the conceptual history and theoretical foundations of solution based casework are presented so that the reader can place this approach to casework within the ongoing professional conversation about what constitutes sound practice section ii addresses issues of assessment and case planning section iii focuses on case management issues and how treatment team members experience a solution based casework approach

the classical approach for solving evolution partial differential equations pdes using a parallel computer consists in first partitioning the spatial domain and assigning each subdomain to a processor to achieve space parallelism then advancing the solution sequentially however enabling parallelism along the time dimension despite its intrinsic difficulty can be of paramount importance to fast computations when space parallelism is unfeasible cannot fully exploit a massively parallel machine or when near real time prediction is desired the aforementioned objective can be achieved by applying classical domain decomposition principles to the time axis the latter is first partitioned into time slices to be processed independently starting with approximate seed information that provides a set of initial conditions the

response is then advanced in parallel in each time slice using a standard time stepping integrator this decomposed solution exhibits discontinuities or jumps at the time slice boundaries if the initial guess is not accurate applying a newton like approach to the time dependent system a correction function is then computed to improve the accuracy of the seed values and the process is repeated until convergence is reached methods based on the above concept have been successfully applied to various problems but none was found to be competitive for even for the simplest of second order hyperbolic pdes a class of equations that covers the field of structural dynamics among others to overcome this difficulty a key idea is to improve the sequential propagator used for correcting the seed values observing that the original evolution problem and the derived corrective one are closely related the present work first demonstrates how this insight can be brought to fruition in the context of linear oscillators with numerical examples featuring structural models ranging from academic to more challenging large scale ones an extension of this method to nonlinear equations is then developed and its concrete application to geometrically nonlinear transient dynamics is presented finally it is shown how the time reversibility property that characterizes some of the above problems can be exploited to develop a new framework that provides an increased speed up factor

numerical solution of partial differential equations iii synspade 1975 provides information pertinent to those difficult problems in partial differential equations exhibiting some type of singular behavior this book covers a variety of topics including the mathematical models and their relation to experiment as well as the behavior of solutions of the partial differential equations involved organized into 16 chapters this book begins with an overview of elastodynamic results for stress intensity factors of a bifurcating crack this text then discusses the effects of nonlinearities such as bifurcation which occur in problems

of nonlinear mechanics other chapters consider the equations of changing type and those with rapidly oscillating coefficients this book discusses as well the effective computational methods for numerical solutions the final chapter deals with the principal results on g convergence such as the convergence of the green s operators for dirichlet s and other boundary problems this book is a valuable resource for engineers and mathematicians
