congenital heart disease is one or more problems with the heart's structure that are present at birth. Congenital means that you're born with the condition. A congenital heart condition can change the way blood flows through the heart. There are many different types of congenital heart defects. A congenital heart defect is a problem with the structure of the heart that a child is born with. Some congenital heart defects in children are simple and don't need treatment. Others are more complex. The child may need several surgeries done over a period of several years.

What is a congenital heart defect (CHD)? A congenital heart defect (CHD) occurs when the heart or the blood vessels near the heart don't develop normally before birth. CHDs occur in about 1 out of 100 babies. Due to advances in early diagnosis, testing, treatment, and surgeries, most young people with these conditions are living into adulthood.

Congenital heart disease (CHD) is a problem with how your heart forms before birth. Some issues are more severe than others, but all of them prevent normal blood flow through your heart and beyond. Advances in diagnosis and treatment help most children with a CHD live to become adults.

To diagnose congenital heart disease in adults, your healthcare professional examines you and listens to your heart with a stethoscope. You are usually asked questions about your symptoms and medical and family history. Congenital heart defects range in severity from simple problems such as holes between
