this volume provides the reader with an overview of the diverse functions of the runx family of genes as highlighted in the introduction and several of the 29 chapters humans and other mammals have three runx genes that are known to play specific roles in blood bone and neuronal development however their evolutionary history has recently been traced back to unicellular organisms and their involvement in many well known signaling pathways wnt tgfb notch hippo is indicative of a more general function in cell biology their documented roles in cell fate decisions include control of proliferation differentiation survival senescence and autophagy the pleiotropic effects of runx in development are mirrored in cancer where runx genes can function as oncogenes that collaborate strongly with myc family oncogenes or as tumour suppressor genes in the latter role they display hallmarks of both gatekeepers that modulate p53 responses and caretakers that protect the genome from dna damage several chapters focus on the importance of these genes in leukemia research where runx1 and cbfb are frequently affected by chromosomal translocations that generate fusion oncoproteins while recent studies suggest wider roles for runx modulation in solid cancers moreover runx genes are intimately involved in the development and regulation of the immune system while emerging evidence suggests a role in innate immunity to infectious agents including hiv at the biochemical level the runx family can serve as activators or repressors of transcription and as stable mediators of epigenetic memory through mitosis not surprisingly runx activity is controlled at multiple levels this includes mirnas and a plethora of post translational modifications several chapters highlight the interplay between the three mammalian runx genes where cross talk and partial functional redundancies are evident finally structural analysis of the runx cbfb interaction has led to the development of small molecule inhibitors that provide exciting new tools to decipher the roles of runx in development and as targets for therapy this volume provides a compendium and reference source that will be of broad interest to cancer researchers developmental biologists and immunologists

a goal of mine ever since becoming an educational researcher has been to help construct a sound theory to guide instructional practice for far too long educational practice has suffered because we have lacked firm instructional guidelines which in my view should be based on sound psychological theory which in turn should be based on sound neurological theory in other words teachers need to know how to teach and that how to teach should be based solidly on how people learn and how their brains function as you will see in this book my answer to the question of how people learn is that we all learn by spontaneously generating and testing ideas idea generating involves analogies and testing requires comparing predicted consequences with actual consequences we learn this way because the brain is essentially an idea generating and testing machine but there is more to it than this the very process of generating and testing ideas results not only in the construction of ideas that work i e the learning of useful declarative

knowledge but also in improved skill in learning i e the development of improved procedural knowledge
