this is a book about physics written for mathematicians the readers we have in mind can be roughly described as those who i are mathematics graduate students with some knowledge of global differential geometry 2 have had the equivalent of freshman physics and find popular accounts of astrophysics and cosmology interesting 3 appreciate mathematical clarity but are willing to accept physical motivations for the mathematics in place of mathematical ones 4 are willing to spend time and effort mastering certain technical details such as those in section 1.1 each book

disappoints so me readers this one will disappoint 1 physicists who want to use this book as a first course on differential geometry 2 mathematicians who think lorentzian manifolds are wholly similar to riemannian ones or that given a sufficiently good mathematical back ground the essentials of a subject ike cosmology can be learned without so me hard work on boring detaiis 3 those who believe vague philosophical arguments have more than historical and heuristic significance that general relativity should somehow be proved or that axiomatization of this subject is useful 4 those who want an encyclopedic treatment the books by hawking ellis 1 penrose 1 weinberg 1 and misner thorne wheeler i go further into the subject than we do see also the survey article sachs wu 1 5 mathematicians who want to learn quantum physics or unified fiield theory unfortunately quantum physics texts all seem either to be for physicists or merely concerned with formai mathematics
