in the four years since the publication of the third edition this book has been very well received by those for whom it was intended candidates for primary examinations in obstetrics and gynaecology in consequence we make no excuse for repeating the formula of addressing only those facts which are neither speculative nor contentious an attempt to widen this brief would multiply the length of the book by three or four times and would place it in an identical category with several much larger texts as the underlying philosophy remains the same the main changes in the fourth edition are the addition of new material and revision of existing material revision of existing material has been extensive with many detailed changes aimed at expanding the factual base while retaining or improving the clarity of explanation in addition the book is now associated with an mcq tutor which has proved especially popular finally and probably most importantly many of the changes are those which have been suggested by readers and reviewers of the previous editions this feedback has been invaluable to the authors and we now hope will be equally valuable to readers of the new edition in this edition we wish to express our particular gratitude to dr john clark and miss lois hague for the very elegant new illustrations in chapter 2

in recent years there has been an impressive surge of interest in the mechanisms which control the onset and the maintenance of labour much of it stems from a constant awareness that gestational age at birth is still an important factor in neonatal mortality and morbidity advances in the sensitivity and specificity of immunoassay the discovery of the prostaglandins new skills in fetal surgery and chronic catheterisation in experimental animals have greatly stimulated further research in this area in the meantime clinicians became continuously more aware that despite considerable advances in perinatal medicine gestational age at birth remains the major determinant of neonatal mortality and morbidity it led them to seek new and better ways of controlling uterine function whether by influencing cervical ripeness by stimulating or by inhibiting myometrial contractility this volume uniquely combines knowledge which has been gained from both experimental and clinical research on parturition a brief outline of current evidence on the control of parturition in experimental animals may be fruitful in delineating problems and hypotheses for further study in human pregnancy much of our present day knowledge of human parturition has been gained by checking such data against experimental findings careful measurements and clinical observations in human pregnancy it is hoped that the interdisciplinary nature of this volume will enhance the understanding of human parturition and stimulate further research in this area thanks are due to miss h wittenberg and mrs m
