Nonstandard Analysis, Axiomatically

2013-03-09

in the aftermath of the discoveries in foundations of mathematic s there was surprisingly little effect on mathematics as a whole if one looks at stan dard textbooks in different mathematical disciplines especially those closer to what is referred to as applied mathematics there is little trace of those developments outside of mathematical logic and model theory but it seems fair to say that there is a widespread conviction that the principles embodied in the zermelo fraenkel theory with choice zfc are a correct description of the set theoretic underpinnings of mathematics in most textbooks of the kind referred to above there is of course no discussion of these matters and set theory is assumed informally although more advanced principles like choice or sometimes replacement are often mentioned explicitly this implicitly fixes a point of view of the mathemat ical universe which is at odds with the results in foundations for example most mathematicians still take it for granted that the real number system is uniquely determined up to isomorphism which is a correct point of view as long as one does not accept to look at unnatural interpretations of the membership relation

Naval Training Bulletin

1946

the minimal polynomials of the images of unipotent elements in irreducible rational representations of the classical algebraic groups over fields of odd characteristic are found these polynomials have the form t 1 d and hence are completely determined by their degrees in positive characteristic the degree of such polynomial cannot exceed the order of a relevant element it occurs that for each unipotent element the degree of its minimal polynomial in an irreducible representation is equal to the order of this element provided the highest weight of the representation is large enough with respect to the ground field characteristic on the other hand classes of unipotent elements for which in every nontrivial representation the degree of the minimal polynomial is equal to the order of the element are indicated in the general case the problem of computing the minimal polynomial of the image of a given element of order p s in a fixed irreducible representation of a classical group over a field of characteristic p 2 can be reduced to a similar problem for certain s unipotent elements and a certain irreducible representation of some semisimple group over the field of complex numbers for the latter problem an explicit algorithm is given results of explicit computations for groups of small ranks are contained in tables i xii the article may be regarded as a contribution to the programme of extending the fundamental results of hall and higman 1956 on the minimal polynomials from p solvable linear groups to semisimple groups

1932

the material in electronics circuits and systems is a truly up to date textbook with coverage carefully matched to the electronics units of the 2007 btec national engineering and the latest as and a level specifications in electronics from aqa ocr and wjec the material has been organized with a logical learning progression making it ideal for a wide range of pre degree courses in electronics the approach is student centred and includes numerous examples and activities web research topics self test features highlighted key facts formulae and definitions each chapter ends with a set of problems including exam style questions and multiple choice questions the book is now also supported by a companion website featuring extensive support for students and lecturers including answers to the questions in the book interactive exercises extra math support and selected illustrations from the book
