neonatal intensive care unit nicu teams in the us and around the world receive performance reports that locate their particular value for selected process and outcome measures within the range of values from all reporting nicus understandably many providers focus primarily if not exclusively on their particular value when a value appears undesirable providers often justify it in an apparent reflex response rather than critically analysing their data exceedingly few reflect on the width or implications of the range within which their performance lies standard medical education does not include these skills yet unwarranted practice variation necessarily compromises a population s overall quality of care researchers report wide variation in health care resource use with little connection to patient outcomes challenging the belief that directing incrementally more resources at certain healthcare problems necessarily produces better results this book provides requisite knowledge to enable readers without research expertise to understand the notion of unwarranted practice variation how to recognize it its ubiquity and why it is generally undesirable why narrowing is pervasiveness improves quality the book begins by describing practice variation its prevalence and why it matters next it examines alternative conceptualizations of nicu work one view is task oriented while the other is aim oriented nicu teams rarely articulate their aims explicitly so this book offers examples that guide thinking and action finally this book asks which rate is right what is the performance target the answer entails identifying the lowest resource use rate associated with desirable outcomes this requires data describing efficient and predictably performing provision of current evidence based care along with relationships to a variety of outcomes provider conceptualization of healthcare quality also is often vague the challenge lies in defining this notion operationally this book does precisely that and gives readers tools to think critically about process outcome and quality measures via some understanding of systems risk adjustment modelling and discriminating signal from noise in process data
