Feasibility Study for Navigation Improvements, Humboldt Harbor and Bay (Deepening) Channels, Humboldt County 2006-08-01 the influence of meteorological conditions and the physical chemical and mineralogical properties of fine grained dredged material on the formation of crusts resulting from evaporative drying in confinement areas was evaluated after decantation the moisture content of the surface layer is equivalent to about 2.5 times the liquid limit evaporation of moisture during the first stage of drying is nearly the same as that from an open pan until the moisture content decreases to about 1.8 times the liquid limit after this drying proceeds at a rate dependent on the transport of moisture to the surface as the material desiccates surface cracks open the volume shrinkage is equivalent to the volume of water evaporated as the crust forms and evidence is given that the volume change is irreversible rainfall is shed from the crust and drains into the cracks from which it can run off if channels are provided to the outflow weir management practices including stirring and the removal of a thin layer of crust produced only small increases in evaporation rate for a few days systems were developed to dig drainage trenches in the confinements and to remove the consolidated crust a small dredge appears to offer the most promise for cutting deep or wide surface drainage ditches

Business Feasibility Analysis Pro 1975 the report presents information developed in the course of a multi year investigation of the need for shore protection and storm damage reduction the study area was 8.6 miles of the pacific coast known as ocean beach in the city of san francisco ca the study area extended from cliff house to fort funston the beach portion of the study area is in the golden gate national recreation area under the jurisdiction of the national park service facilities threatened with damage included the great highway parking lots of the ggnra a buried storm and sewer water transport box a sewer pumping plant and ultimately houses and businesses the report records the ocean engineering economic and geotechnical studies used to formulate and analyze a variety of alternative measures including structural seawalls and revetments as well as beach and dune nourishment the final analysis indicated that most of the study area while not absolutely safe had a low probability of erosion in the one area with a possible federal interest the sponsor was unable to agree to cost share at the time of the report therefore the study was terminated the sponsor will pursue other measures not requiring federal cost sharing
