the authors consider a Schrödinger operator $h \square v(x)$ in dimension two with a quasi-periodic potential $v(x)$ they prove that the absolutely continuous spectrum of h contains a semi-axis and there is a family of generalized eigenfunctions at every point of this semi-axis with the following

properties first the eigenfunctions are close to plane waves $e^{i\mathbf{k}\cdot\mathbf{x}}$ in the high energy region second the isoenergetic curves in the space of momenta \mathbf{k} corresponding to these eigenfunctions have the form of slightly distorted circles with holes cantor type structure a new method of multiscale analysis in the momentum space is developed to prove these results the result is based on a previous paper on the quasiperiodic polyharmonic operator $\Delta + V(x)$ here the authors address technical complications arising in the case $l=1$ however this text is self contained and can be read without familiarity with the previous paper
