universal v ray settings this page provides a tutorial on universal settings for v ray that work for most still images overview the universal settings comprise a set of settings that work very well for still images in many situations and are the default for v ray next please note that these settings are not optimal in the sense that with enough tweaking you can probably get similar quality with faster render times the beauty of these settings though is that they require almost no tweaking and you are guaranteed to get a good result in the end the advantages of these settings are o very little parameters for controlling render quality vs speed o works for a very large number of scenes o produces high quality results with the progressive image sampler the default render time min is set to 1 0 which might be insufficient for some scenes you can reset this to 0 0 min and rendering will continue until the noise threshold is reached setting the v ray renderer 1 set v ray as the current rendering engine with the default v ray settings 2 the default settings are optimized to work universally so it is recommended to keep them progressive image sampler with 100 max subdivs and 1 min subdivs gi enabled using brute force as primary gi engine and light cache as secondary gi engine 3 you can further refine the noise levels from the progressive image sampler rollout by adjusting the noise threshold and placing a 0 value for the render time min 4 you can control the amount of aa vs shading samples for materials lights gi using the min shading rate parameter in the image sampler rollout but the default value is optimised to work well for the majority of scenes

once warehoused in institutions many severely handicapped individuals are now living in community residences yet there are few resource materials available for those who face the difficult task of planning and operating these residences a user s guide to community entry for the severely handicapped offers practical guidance for creating the most home like least restrictive residential settings committed to the right of all individuals to live in their home community pancsofar and blackwell address topics of vital concern to residential planners administrators and direct care

personnel the guide covers administrative and programmatic issues offering a wealth of suggestions examples forms and checklists it is a valuable special education textbook and reference work and an excellent resource for families

this scoring cd rom includes a complete copy of the checklist and a user's guide allowing busy clinicians to use the checklist by itself as a quick valid screening system users input responses from the completed checklist and the program calculates composite percentiles and standard scores based on the embedded norms this program also makes correspondence and recordkeeping easier it automatically generates a screening report for clinicians to add to the child's health record then the clinician can select from a menu of three letters to share personalized results and recommendations with the family

2003

arnold arnold is an advanced cross platform rendering library or api developed by solid angle and used by a number of prominent organizations in film television and animation including sony pictures imageworks it was developed as a photo realistic physically based ray tracing alternative to traditional scanline based rendering software for cg animation arnold uses cutting edge algorithms that make the most effective use of your computer s hardware resources memory disk space multiple processor cores and simd sse units the arnold architecture was designed to easily adapt to existing pipelines it is built on top of a pluggable node system users can extend and customize the system by writing new shaders cameras filters and output driver nodes as well as procedural geometry custom ray types and user defined geometric data the primary goal of the arnold architecture is to provide a

complete solution as a primary renderer for animation and visual effects however arnold can also be used as a ray server for traditional scanline renderers a tool for baking procedural generation of lighting data lightmaps for videogames an interactive rendering and relighting tool why is arnold different arnold is a highly optimized unbiased physically based monte carlo ray path tracing engine it doesn't use caching algorithms that introduce artifacts like photon mapping and final gather it is designed to efficiently render the increasingly complex images demanded by animation and visual effects facilities while simplifying the pipeline infrastructure requirements and user experience arnold provides interactive feedback often avoiding the need for many render passes and allowing you to match on set lighting more efficiently by removing many of the frustrating elements of other renderers arnold fits better with your work flow produces beautiful predictable and bias free results and puts the fun back into rendering what is wrong with algorithms like photon mapping or final gather such algorithms attempt to cache data that can be re sampled later to speed up rendering however in doing so they use up large amounts of memory introduce bias into the sampling that cause visual artifacts they also require artists to understand the details of how these algorithms work in order to correctly choose various control settings in order to get any speed up at all without ruining the render worse than that these settings are almost always affected by other things in the scene so it s often possible to accidentally use settings for the cache creation use that make things worse not better or that work fine in one situation but are terrible in another seemingly similar situation in short they are not predictable other than for very experienced users and require artists to learn way too much about the algorithms in order to gain any benefit at solid angle we believe that your time is more valuable than your computer s time why spend an extra 30 minutes working with photon mapping or final gather settings even if it saves 30 minutes render time and more often than not it doesn t that s still 30 minutes not spent modeling animating or lighting

compiled edited by f william payne natural gas technologies that were new five years ago have now been tested in the real world this book describes some of these important technologies covering both new engineering concepts and new products which have emerged as well as important innovations

to existing technologies many of the chapters include economic analyses which identify the resulting cost savings specific areas of development addressed include gas cooling chillers desiccant technologies cogeneration heating systems and other natural gas technologies
