in the literature dealing with patterns with variables a word also called string is a sequence of terminal letters while a pattern is a sequence of terminal and variable letters the problem of deciding if there is a substitution for all the variables in a pattern such that a target word is obtained is the matching problem for patterns with variables in many problems related to the processing of textual data it is essential to model uncertainty in the text such as e g typos in handwritten texts or mutations in biological data for this reason i introduce and present in this the

knowledge management and knowledge engineering is a fascinating field of research these days in the beginning of the 20th century the modeling and acquisition of knowledge was the privilege of or rather a burden for a few knowledge engineers familiar with knowledge engineering paradigms and knowledge representation formalisms while the aim has always been to model knowledge declaratively and allow for reusability the knowledge models produced in these early days were typically used in single and very specific applications and rarely changed moreover these models were typically rather complex and they could be understood only by a few expert knowledge engineers this situation has changed radically in the last few years as clearly indicated by the following trends the creation of even formal knowledge is now becoming more and more collaborative collaborative ontology engineering tools and social software platforms show the potential to leverage the wisdom of the crowds or at least of the many to lead to broader consensus and thus produce shared models which qualify better for reuse a trend can also be observed towards developing and publishing small but high impact vocabularies e.g. foaf, Dublin Core, Good Relations rather than complex and large knowledge models

Variables and Patterns

2002

the question paper of grade 12 life sciences march 2014 caps

the understanding of empirical traffic congestion occurring on unsignalized multi lane highways and freeways is a key for effective traffic management control or nization and other applications of transportation engineering however the traffic flow theories and models that dominate up to now in transportation research journals and teaching programs of most universities cannot explain either traffic breakdown or most features of the resulting congested patterns these theories are also the basis of most dynamic traffic assignment models and freeway traffic control methods which therefore are not consistent with features of real traffic for this reason the author introduced an alternative traffic flow theory called three phase traffic theory which can predict and explain the empirical spatiotemporal features of traffic breakdown and the resulting traffic congestion a previous book the physics of traffic springer berlin 2004 presented a discussion of the empirical spatiotemporal features of congested traffic patterns and of three phase traffic theory as well as their engineering applications rather than a comprehensive analysis of empirical and theoretical results in the field the present book includes no more empirical and theoretical results than are necessary for the understanding of vehicular traffic on unsignalized multi lane roads the main objectives of the book are to present an elementary traffic flow theory and control methods as well as to show links between three phase traffic theory and earlier traffic flow theories the need for such a book follows from many comments of colleagues made after publication of the book the physics of traffic

Programming Languages and Systems

2010-03-10

activity theory is a way of describing and characterizing the structure of human activity of all kinds first introduced by russian psychologists rubinshtein leontiev and vigotsky in the early part of the last century activity theory has more recently gained increasing attention among interaction designers and others in the human computer interaction and usability communities see for example gay and h brooke 2004 interest was given a significant boost when donald norman suggested activity theory and activity centered design as antidotes to some of the putative ills of human centered design norman 2005 norman who has been credited with coining the phrase user centered design suggested that too much attention focused on human users may be harmful that to design better tools designers need to focus not so much on users as on the activities in which users are engaged and the tasks they seek to perform within those activities although many researchers and practitioners claim to have used or been influenced by activity theory in their work see for example nardi 1996 it is often difficult to trace precisely where or how the results have actually been shaped by activity theory in many cases even detailed case studies report results that seem only distantly related if at all to the use of activity theory contributing to the lack of precise and traceable impact is that activity theory spite its name is not truly a formal and proper theory

POSSIBILITY THINKING: EXPLORATIONS IN LOGIC AND THOUGHT

2015-11-03

what are groups how do they behave arrow mcgrath and berdahl answer these questions by developing a general theory of small groups as complex systems basing their theory on concepts distilled from general systems theory dynamical systems theory and complexity and chaos theory they explore groups as adaptive dynamic systems that are driven by interactions among group members as well as between the group and its embedding contexts in addition they consider not only the group s members and their distribution of attributes but also the group s tasks and technology in order to understand how those members tasks and tools are intertwined coordinated and adjusted throughout the book the authors focus our attention on relationships among people tools and tasks that are activated by a combination of individual and collective purposes and goals that change and evolve as the group interacts over time

Applied Multivariate Research

2016-10-28

this book constitutes the refereed proceedings of the 13th international conference on reversible computation rc 2021 which was held online during july 7 8 2021 the 11 papers included in this book were carefully reviewed and selected from 21 submissions the book also contains 2 invited talks in full paper length 3 work in progress papers and 1 tool paper they were organized in topical sections named programming and programming languages reversible concurrent computation theory and foundations and circuit synthesis

Methods of Assessing the Reinforcing Properties of Abused Drugs

this volume contains the proceedings of icalp 88 held at tampere university of technology finland july 11 15 1988 icalp 88 is the 15th international colloquium on automata languages and programming in a series of meetings sponsored by the european association for theoretical computer science eatcs it is a broadly based conference covering all aspects of theoretical computer science including topics such as computability automata formal languages analysis of algorithms computational complexity data types and data structures theory of data bases and knowledge bases semantics of programming languages program specification transformation and verification foundations of logic programming theory of logical design and layout parallel and distributed computation theory of concurrency symbolic and algebraic computation term rewriting systems cryptography and theory of robotics

Introduction to Modern Traffic Flow Theory and Control

2009-09-16

this book constitutes the thoroughly refereed post proceedings of the 8th international workshop on runtime verification rv 2008 held in budapest hungary in march 2008 as satellite event of etaps 2008 the 9 revised full papers presented together with 2 invited papers were carefully selected from 27 initial submissions the subject covers several technical fields such as runtime verification runtime checking runtime monitoring and security and safety matters

Human-Centered Software Engineering

2009-06-19

mathematics curriculum which is often a focus in education reforms has not received extensive research attention until recently ongoing mathematics curriculum changes in many education systems call for further research and sharing of effective curriculum policies and practices that can help lead to the improvement of school education this book provides a unique international perspective on diverse curriculum issues and practices in different education systems offering a comprehensive picture of various stages along curriculum transformation from the intended to the achieved and showing how curriculum changes in various stages contribute to mathematics teaching and learning in different educational systems and cultural contexts the book is organized to help readers learn not only from reading individual chapters but also from reading across chapters and sections to explore broader themes including identifying what is important in mathematics for teaching and learning in different education systems understanding mathematics curriculum and its changes that are valued over time in different education systems identifying and analyzing effective curriculum practices probing effective infrastructure for curriculum development and implementation mathematics curriculum in school education brings new insights into curriculum policies and practices to the international community of mathematics education with 29 chapters and four section prefaces contributed by 56 scholars from 14 different education systems this rich collection is indispensable reading for mathematics educators researchers curriculum developers and graduate students interested in learning about recent curriculum development research and practices in different education systems it will help readers to reflect on curriculum policies and practices in their own education systems and also inspire them to identify and further explore new areas of curriculum research for improving mathematics teaching and learning

Small Groups as Complex Systems

2000-03-21

the two volume set lncs 9256 and 9257 constitutes the refereed proceedings of the 16th international conference on computer analysis of images and patterns caip 2015 held in valletta malta in september 2015 the 138 papers presented were carefully reviewed and selected from numerous submissions caip 2015 is the sixteenth in the caip series of biennial international conferences devoted to all aspects of computer vision image analysis and processing pattern recognition and related fields

Reversible Computation

2021-06-22

systems programming provides the foundation for the world s computation writing performance sensitive code requires a programming language that puts programmers in control of how memory processor time and other system resources are used the rust systems programming language combines that control with a modern type system that catches broad classes of common mistakes from memory management errors to data races between threads with this practical guide experienced systems programmers will learn how to successfully bridge the gap between performance and safety using rust jim blandy jason orendorff and leonora tindall demonstrate how rust s features put programmers in control over memory consumption and processor use by combining predictable performance with memory safety and trustworthy concurrency you ll learn rust s fundamental data types and the core concepts of ownership and borrowing how to write flexible efficient code with traits and generics how to write fast multithreaded code without data races rust s key power tools closures iterators and asynchronous programming collections strings and text input and output macros unsafe code and foreign function interfaces this revised updated edition covers the rust 2021 edition
