erlang

erlang

1990

erlang is a programming language designed for building distributed, fault-tolerant, and real-time systems. It was developed by Ericsson in the late 1980s and early 1990s. The language is based on the concept of actors, which are independent processes that communicate with each other through message passing. Erlang is known for its ability to handle high loads and its fault-tolerance, which is achieved through the use of supervisors and the 'let it crash' philosophy. The language is also known for its real-time capabilities, which are achieved through its garbage collection and scheduling mechanisms. Erlang is widely used in the telecommunications industry, particularly in the development of core network elements and service-oriented architectures. It is also used in other industries, such as finance and e-commerce, for building scalable and reliable systems. The language has a strong community and a rich ecosystem of libraries and tools. Erlang is a powerful and flexible programming language that is well-suited for building distributed and real-time systems.
