demonstrated the ability to model and predict accurately a wide range of physical properties and phenomena many of these have had an important impact in contributing to wealth creation and improving the quality of life through the development of new products and processes with greater efficacy efficiency or reduced harmful side effects and in contributing to our ability to understand and describe the world around us following a survey of the u.k.'s urgent need for a supercomputing facility for academic research see next chapter a 256 processor t3d system from cray research inc went into operation at the university of edinburgh in the summer of 1994 the high performance computing initiative hpci was established in november 1994 to support and ensure the efficient and effective exploitation of the t3d and future generations of hpc systems by a number of consortia working in the frontier areas of computational research the cray t3d now comprising 512 processors and total of 32

cb memory represented a very significant increase in computing power allowing simulations to move forward on a number of fronts the three fold aims of the hpci may be summarised as follows 1 to seek and maintain a world class position in computational science and engineering 2 to support and promote exploitation of hpc in industry commerce and business and 3 to support education and training in hpc and its application this essential trade reference offers more than fifty crucial forms and tells you everything you need to know to use them effectively all for 5 less than the first edition made feasible solutions is both finite and discrete i.e. enumerable for example the traveling salesman problem asks in what order a salesman should visit the cities in his territory

if he wants to minimize his total mileage see sect 2 2 2 the traveling salesman problem s feasible solutions permutations of city labels comprise a finite discrete set by contrast differential evolution was originally designed to optimize functions defined on real spaces unlike combinatorial problems the set of feasible solutions for real parameter optimization is continuous although differential evolution operates internally with floating point precision it has been applied with success to many numerical optimization problems that have traditionally been classified as combinatorial because their feasible sets are discrete for example the knapsack problem s goal is to pack objects of differing weight and value so that the knapsack s total weight is less than a given maximum and the value of the items inside is maximized see sect 2 2 1 the set of feasible solutions vectors whose components are nonnegative integers is both numerical and discrete to handle such problems while retaining full precision differential evolution copies floating point solutions to a temporary vector that prior to being evaluated is truncated to the nearest feasible solution e g by rounding the temporary parameters to the nearest nonnegative integer
