to the terminal bronchiole it is characterized by abnormal permanent enlargement of lung air spaces with the destruction of their walls without any fibrosis and destruction of lung parenchyma with loss of elasticity an increase in inflammatory cells has been documented in the lungs of patients with emphysema following smoke exposure patients have an influx of macrophages and neutrophils into the lung neutrophils are implicated not only in disease initiation but also in exacerbations emphysema loss of alveolar structure chronic bronchitis long term inflammation of the airways and mucus hyper secretion the persistent respiratory symptoms consistent with the disease reflect the permanent changes that take place in the lung structures and include breathlessness cough and sputum production emphysema destroys the essential ventilatory units and interrupts the gas exchange functionally emphysema causes obstructive ventilatory defect evidenced in the spirometry and is included in the collective diseases of chronic obstructive pulmonary disease commonly termed as copd natural therapies for emphysema and copd relief and healing for chronic pulmonary disorders robert j green
