the mga truly marked a revolution in mg sports car design with its appearance quite unlike any previous production car from the celebrated british marque entering production in the summer of 1955 it broke with the time honoured tradition of narrow gutted flat sides upright styling with the distinctive large grille exposed headlamps separate wings and sharply cut off tail that had serviced the majority of mg sports cars for well over thirty years many die hard mg enthusiasts of the time were understandably outraged but the decision to break with tradition proved to be a good one over 100 000 cars were produced over the model s seven year lifetime this book from celebrated author david knowles covers the circumstances that led to the momentous decision to make such a fundamental design change the production publicity and evolution of each and every mga variant from launch in 1955 to the end of production in 1962 with specification tables for each model profiles of the people who had crucial roles in the development of the mga and finally the largely untold story of overseas assembly in australia ireland mexico and south africa it

offers comprehensive coverage of racing and rallying in europe including the mga entries at sebring twelve hour race and where many of the cars ended up and will be of great interest to all motoring enthusiasts and those particularly interested in mg it is extensively illustrated with 200 colour and 300 black white photographs much of it drawn from archives and family collections as well as photoshoots specially commissioned for this book david knowles has been researching and writing about british cars for over twenty five years

control systems have come to play an important role in the performance of modern vehicles with regards to meeting goals on low emissions and low fuel consumption to achieve these goals modeling simulation

and analysis have become standard tools for the development of control systems in the automotive industry modeling and control of engines and drivelines provides an up to date treatment of the topic from a clear perspective of systems engineering and control systems which are at the core of vehicle design this book has three main goals the first is to provide a thorough understanding of component models as building blocks it has therefore been important to provide measurements from real processes to explain the underlying physics to describe the modeling considerations and to validate the resulting models experimentally second the authors show how the models are used in the current design of control and diagnosis systems these system designs are never used in isolation so the third goal is to provide a complete setting for system integration and evaluation including complete vehicle models together with actual requirements and driving cycle analysis key features covers signals systems and control in modern vehicles covers the basic dynamics of internal combustion engines and drivelines provides a set of standard models and includes examples and case studies covers turbo and super charging and automotive dependability and diagnosis accompanied by a web site hosting example models and problems and solutions modeling and control of engines and drivelines is a comprehensive reference for graduate students and the authors close collaboration with the automotive industry ensures that the knowledge and skills that practicing engineers need when analysing and developing new powertrain systems are also covered
