anaerobic oxidation of methane (AOM) coupled to sulfate reduction (AOSR) is a biological process mediated by anaerobic methanotrophs (ANME) and sulfate-reducing bacteria. It has scientific and societal relevance in regulating the global carbon cycle and biotechnological application for treating sulfate-rich wastewater. This research aimed to enhance the recent knowledge on ANME distribution and its enrichment in different bioreactor configurations, i.e. membrane bioreactor (MBR), bio-trickling filter (BTF), and high-pressure bioreactor (HPB). Marine sediment from Ginsburg mud volcano, Gulf of Cadiz, was used as inoculum in the BTF and MBR. The BTF operation showed the enrichment of ANME-1 (40%) and ANME-2 (10%), whereas the dominance of ANME-2 and Desulfosarcina aggregates was observed in the MBR. Moreover, the HPB study was performed by using highly enriched ANME-2 community from Captain Arutyunov mud volcano during the study of HPB at different temperature and pressure conditions. The incubation at 10 MPa pressure and 15 °C was observed to be the most suitable condition for the studied AOM/SR community. Furthermore, AOM/SR activity in the coastal sediments from Marine Lake Grevelingen, the Netherlands, was explored and the microbial community was characterized, which was dominated by ANME-3 among known ANME types.

flood catastrophes which happened world wide have shown that it is not sufficient to characterize the hazard caused by the natural phenomenon flood with the well known 3m approach measuring mapping and modelling due to the recent shift in paradigms from a safety oriented approach to risk based planning it became necessary to consider the harmful impacts of hazards the planning tasks changed from attempts to minimise hazards towards interventions to reduce exposure or susceptibility and nowadays to enhance the capacities to increase resilience scientific interest shifts more and more towards interdisciplinary approaches which are needed to avoid disaster this book deals with many aspects of flood risk management in a comprehensive way as risks depend on hazard and vulnerabilities not only geophysical tools for flood forecasting and planning are presented but also socio economic problems of flood management are discussed starting with precipitation and meteorological tools to its forecasting hydrological models are described in their applications for operational flood forecasts considering model uncertainties and their interactions with hydraulic and groundwater models with regard to flood risk planning regionalization aspects and the options to utilize historic floods are discussed new hydrological tools for flood risk assessments for dams and reservoirs are presented problems and options to quantify socio economic risks and how to consider them in multi criteria assessments of flood risk planning are discussed this book contributes to the contemporary efforts to reduce flood risk at the european scale using many real world examples it is useful for scientists and practitioners at different levels and with different interests
