silicon technology now allows us to build chips consisting of tens of millions of transistors this technology not only promises new levels of system integration onto a single chip but also presents significant challenges to the chip designer as a result many asic developers and silicon vendors are re examining their design methodologies searching for ways to make effective use of the huge numbers of gates now available these designers see current design tools and methodologies as inadequate for developing million gate asics from scratch there is considerable pressure to keep design team size and design schedules constant even as design complexities grow tools are not providing the productivity gains required to keep pace with the increasing gate counts

available from deep submicron technology design reuse the use of pre designed and pre verified cores is the most promising opportunity to bridge the gap between available gate count and designer productivity reuse methodology manual for system on a chip designs second edition outlines an effective methodology for creating reusable designs for use in a system on a chip soc design methodology silicon and tool technologies move so quickly that no single methodology can provide a permanent solution to this highly dynamic problem instead this manual is an attempt to capture and incrementally improve on current best practices in the industry and to give a coherent integrated view of the design process reuse methodology manual for system on a chip designs second edition will be updated on a regular basis as a result of changing technology and improved insight into the problems of design reuse and its role in producing high quality soc designs

the microelectronics market with special emphasis to the production of complex mixed signal systems on chip soc is driven by three main dynamics time market productivity and managing complexity pushed by the progress in na meter technology the design teams are facing a curve of complexity that grows exponentially thereby slowing down the productivity design rate analog design automation tools are not developing at the same pace of technology once custom design characterized by decisions taken at each step of the analog design flow lies most of the time on designer knowledge and expertise actually the use of sign management platforms like the cadences virtuoso platform

with a set of integrated cad tools and database facilities to deal with the design transformations from the system level to the physical implementation can significantly speed up the design process and enhance the productivity of analog mixed signal integrated circuit ic design teams these design management platforms are a valuable help in analog ic design but they are still far behind the development stage of design automation tools already available for digital design therefore the development of new cad tools and design methodologies for analog and mixed signal ics is essential to increase the designer's productivity and reduce design productivity gap the work presented in this book describes a new design automation approach to the problem of sizing analog ics
