Risk factors in coronary disease 1977 identifies the quantitative measures to assess behavior induced risks presents a framework to limit the interpersonal tension of addressing behavioral risks offers an empirical case study in the oil and gas domain demonstrating use of the framework addresses the missing dimension of behavior centric intangible risk factors in current risk identification and management processes provides a systematic analytical approach to mitigate subjectivity when addressing behavioral risks in projects

Multiple risk factors in cardiovascular disease 1992 a risk factor is anything that increases the risk of disease in an individual
Cardiovascular Risk Factors in Children 1980 this volume is a collection of the most significant contributions to the 4th international symposium on multiple risk factors in cardiovascular disease strategies of prevention of coronary heart disease cardiac failure and stroke held in washington d c in april 1997 the meeting focused on the risk factors for cardiovascular disease and their interactions the need for this symposium is based on the epidemiological clinical and biological evidence that individuals from industrialized countries often possess two or more risk factors which synergistically increase the global risk profile this has become more evident in recent years with the increase in life expectancy of populations in the industrialized countries the evidence that a combination of risk factors confers a very high risk of developing cardiovascular diseases is of pivotal interest in the process of detection of patients who will benefit the most from pharmacological treatment many recent epidemiological data identifying the intrinsic and environmental factors contributing to the development of atherosclerosis are discussed these results in parallel with basic and clinical research underline atherosclerosis as a complex and multifactorial process involving the influences of lipids including lipoprotein subfractions blood pressure rheologic forces carbohydrate tolerance and thrombogenic factors including fibrinogen tissue factor pal i and homocysteine furthermore the risk associated with anyone of these risk factors varies widely depending on the level of the associated atherogenic risk factors hypercholesterolemia and hypertriglyceridemia for instance are more common than would be expected by chance among hypertensive patients

Decision Making in Risk Management 2021-07-25 this book includes the most significant contributions of the 3rd international symposium on multiple risk factors in cardiovascular disease held in florence italy july 6 9 1994 the meeting focused on the risk factors for cardiovascular disease and their interactions the need for this symposium is based on the epidemiological evidence that individuals from industrialized countries often possess two or more risk factors which synergistically increase the global risk profile this has become more evident in recent years with the increase in life expectancy of the general population the evidence that in high risk patients a combination of risk factors often is detected is highlighted in these proceedings many recent epidemiological data identifying the intrinsic and environmental factors contributing to the development of atherosclerosis are discussed these results in parallel with basic and clinical research underline how atherosclerosis is a complex and multifactorial process involving the influences of lipids including lipoprotein subfractions blood pressure rheologic forces carbohydrate tolerance and thrombogenic factors furthermore the risk associated with anyone of these risk factors varies widely depending on level of the associated atherogenic risk factors

Risk Factors in Surgery 1994 promoting developments in the diagnosis prevention and treatment of coronary artery disease this reference furnishes the latest information on new and emerging risk factors for atherothrombotic vascular disorders analyzing lipid related and psychosocial risk factors the genetic aspects of disease the potential role of infection and inflammation metabolic syndrome and insulin resistance and elevated blood levels of homocysteine and hemostatic factors

Multiple Risk Factors in Cardiovascular Disease 1995 treatment planning for implant therapy has changed dramatically in recent years as new protocols have evolved for techniques such as immediate loading and the use of short implants this new edition has been updated to reflect the most important advances in implant dentistry while still focusing on the patient risk assessment that is essential to successful long term implant treatment this book offers a clear practical methodology for defining and evaluating the impact of various risk factors on individual patients considering therapy in addition specific guidelines and checklists are included to give specialists and general practitioners alike increased confidence in discussing implant therapy with their patients the risk factors and limitations associated with various presentations of edentulism are described in detail and the safest treatment options are given for each including surgical protocols and solutions to bone related problems

Public Health and the Risk Factor 2003 this report builds on the previous aihw report chronic disease and participation in work by showing the association between risk factors and participation in work in 2004 05 nearly all 96 working age people in australia reported one health risk factor and three quarters reported more than one people who reported three or more risk factors were significantly more likely to not participate in the labour force compared with those who reported no risk factors absentee rates for people who reported a risk factor and a chronic disease were significantly higher compared with people reporting no risk factors and no chronic disease this report is a further reminder of the importance of reducing risk factor prevalence to lessen the impact of future chronic disease among working age people

Multiple Risk Factors in Cardiovascular Disease 2012-11-05 recent health care payment reforms aim to improve the alignment of medicare payment strategies with goals to improve the quality of care provided patient experiences with health care and health outcomes while also controlling costs these efforts move medicare away from the volume based payment of traditional fee for

service models and toward value based purchasing in which cost control is an explicit goal in addition to clinical and quality goals specific payment strategies include pay for performance and other quality incentive programs that tie financial rewards and sanctions to the quality and efficiency of care provided and accountable care organizations in which health care providers are held accountable for both the quality and cost of the care they deliver accounting for social risk factors in medicare payment criteria factors and methods is the third in a series of five brief reports that aim to inform aspe analyses that account for social risk factors in medicare payment programs mandated through the impact act this report builds on the conceptual relationships and empirical associations between social risk factors and performance indicators used in value based payment identified in the first report to provide guidance on which factors could be considered for medicare accounting purposes criteria to identify these factors and methods to do so in ways that can improve care and promote greater health equity for socially at risk patients

Risk Factors in Breast Cancer 1975 strategic health planning the cornerstone of initiatives designed to achieve health improvement goals around the world requires an understanding of the comparative burden of diseases and injuries their corresponding risk factors and the likely effects of intervention options the global burden of disease framework originally published in 1990 has been widely adopted as the preferred method for health accounting and has become the standard to guide the setting of health research priorities this publication sets out an updated assessment of the situation with an analysis of trends observed since 1990 and a chapter on the sensitivity of gbd estimates to various sources of uncertainty in methods and data

Risk Factors in Cardiovascular Disease 1980 the link between commodities prices and the business cycle including variables such as real gdp industrial production unemployment inflation and market uncertainty has often been debated in the macroeconomic literature to quantify the impact of commodities on the economy one can distinguish different modeling approaches first commodities can be represented as the pinnacle of cross sectional financial asset prices second price fluctuations due to seasonal variations dramatic market changes political and regulatory decisions or technological shocks may adversely impact producers who use commodities as input this latter effect creates the so called commodities risk additionally commodities price fluctuations may spread to other sectors in the economy via contagion effects besides stronger investor interest in commodities may create closer integration with conventional asset markets as a result the financialization process also enhances the correlation between commodity markets and financial markets our objective in this book risk factors and contagion in commodity markets and stocks markets lies in answering the following research questions what are the interactions between commodities and stock market sentiment do some of these markets move together overtime did the financialization in energy commodities occur after the 2008 global financial crisis these questions are essential to understand whether commodities are driven only by their fundamentals or whether there is also a systemic component influenced by the volatility present within the stock markets

Coronary Risk Factors in Japan and China 1987-03-13 metabolic and endocrine disorders are the main burden of noncommunicable chronic diseases and they serve as important risk factors for cardiovascular diseases or multiple cancers to date a large number of

correlates have been identified but few of them were modifiable and causal in general causal relationships can be conceptualized not only in a probabilistic sense involving statistical terms and procedures but also in the complexity of biological phenomena the limited understanding of many underlying mechanisms hinders a deterministic conceptualization of disease causation the identification of modifiable risk factors that have a causal effect on the incidence of these diseases and their complications is critical to the primary or secondary prevention of metabolic and endocrine diseases
