Methods in Rock Magnetism and Palaeomagnetism

during the last 30 years the study of the magnetic properties of rocks and minerals has substantially contributed to several fields of science perhaps the best known and most significant advances have resulted from the study of palaeomagnetism which led to quantitative confirmation of continental drift and polar wandering through interpretation of the direction of remanent magnetism observed in rocks of different ages from different continents palaeomagnetism has also through observations of reversals of magnetiz ation ancient secular variation and ancient field intensities provided data relevant to the origin of the geomagnetic field and other investigations have contributed significantly to large scale and local geological studies the dating of archaeological events and artefacts and more recently to lunar and meteoritic studies rock and mineral magnetism has proved to be an interesting study in its own right through the complex magnetic

properties and interactions observed in the iron titanium oxide and iron sulphide minerals as well as contributing to our understanding of remanent magnetism and magnetization processes in rocks simultaneous with the development of these studies has been the development of instruments and techniques for the wide range of investigations involved

excerpt from college teaching studies in methods of teaching in the college the student of general problems of education or of elementary education finds an extensive literature of varying worth in the last decade our secondary schools have undergone radical reorganization and have assumed new functions a rich literature on every phase of the high school is rapidly developing to keep pace with the needs and the progress of secondary education the literature on college education in general and college pedagogy in particular is surprisingly undeveloped this dearth is not caused by the absence of problem for indeed there is room for much improvement in the organization the administration and the pedagogy of the college investigators of these problems have been considerably discouraged by the facts they have gathered this volume is conceived in the hope of stimulating an interest in the quality of college teaching and initiating a scientific study of college pedagogy the field is almost virgin and the need for constructive programs is acute we therefore ask for our effort the indulgence that is usually accorded a pioneer in this age of specialization of study it is evident that no college teacher however wide his experience and extensive his education can speak with authority on the teaching of all the subjects in the college curriculum or even of all the major ones for this reason this volume is the product of a cooperating authorship the editor devotes himself to the study of general methods of teaching that apply to almost all subjects and to most teaching situations in addition he coordinates the work of the other contributors he realizes that there exists among college professors an active hostility to the study of pedagogy the professors feel that one who knows his subject can teach it the contributors have been purposely selected in order to dispel this hostility they are one and all men of undisputed scholarship who have realized the need of a mode of presentation that will make their knowledge alive about the publisher forgotten books publishes hundreds of thousands of rare and classic books find more at forgottenbooks.com this book is a reproduction of an important historical work forgotten books uses state of the art technology to digitally reconstruct the work preserving the original format whilst

repairing imperfections present in the aged copy in rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition we do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works

this book presents two kinds of numerical methods for solving elliptic boundary value problems with singularities part i gives the boundary methods which use analytic and singular expansions and part ii the nonconforming methods combining finite element methods fem or finite difference methods fdm and singular or analytic expansions the advantage of these methods over the standard fem and fdm is that they can cope with complicated geometrical boundaries and boundary conditions as well as singularity therefore accurate numerical solutions near singularities can be obtained the description of methods error bounds stability analysis and numerical experiments are provided for the typical problems with angular interface and infinity singularities however

the approximate techniques and coupling strategy given can be applied to solving other pde and engineering problems with singularities as well this book is derived from the author s ph d thesis which won the 1987 best doctoral dissertation award given by the canadian applied mathematics society

the development of equipment capable of producing and monitoring safe effective and predictable hyperthermia treatments represents a major challenge the main problem associated with any heating technique is the need to adjust and control the distribution of absorbed power in the tissue during treatment power distribution is considered adequate only when tumor tissue can be maintained at the required hyperthermic levels while at the same time healthy tissue is not overheated this problem is particularly crucial when external heating devices are used to produce hyperthermia external hyperthermia refers to those methods which supply heat to tumor tissue in an external noninvasive manner as opposed to internal hyperthermia by which heat is supplied to tumor tissue in situ until recently most of the technical developments and clinical trials of ther motherapy for superficial and deep tumors have been based on electromagnetic systems presently there is increasing interest in the use of ultra sound to accomplish these goals electromagnetic techniques of external thermotherapy include radiative capacitive and to a lesser extent inductive procedures recent designs for radiative applicators have incorporated microstrip structures these have the advantage of being compact and lightweight compared with dielectrically loaded waveguide applicators
