the first mexican meeting on mathematical and experimental physics was held at el colegio nacional in mexico city and mexico from september 10 to 14 2001 this event consisted of the leopoldo garcia colin scherer medal lecture delivered by prof nicholas g van kampen a series of plenary talks by leopoldo garcia colin giinter nimtzt luis f rodriguez ruon barrera and donald saari and of three parallel symposia namely cosmology and gravitation statistical physics and beyond and hydrodynamics and dynamical systems the response from the physics community was enthusiastic with over 200 participants and around

80 speakers from all over the world USA Canada Mexico Germany France Holland United Kingdom Switzerland Spain and Hungary the main aim of the conference is to provide a scenario to Mexican researchers on the topics of mathematical and experimental physics in order to keep them in contact with work going on in other parts of the world and at the same time to motivate and support the young and mid career researchers from our country to achieve this goal we decided to invite the most distinguished experts in the subjects of the conference and to give the opportunity to young scientists to communicate the results of their work the plan is to celebrate this international endeavor every three years

Introduction To Modern Physics

2001

In the last 20 years the disciplines of particle physics astrophysics nuclear physics and cosmology have grown together in an unprecedented way a brilliant example is nuclear double beta decay an extremely rare radioactive decay mode which is one of the most exciting and important fields of research in particle physics at present and the flagship of non accelerator particle physics while already discussed in the 1930s only in the 1980s was it understood that neutrinoless double beta decay can yield information on the Majorana mass of the neutrino which has an impact on the structure of space time today double beta decay is indispensable for solving the problem of the neutrino mass spectrum and the structure of the neutrino mass matrix the potential of double beta decay has also been extended such that it is now one of the most promising tools for probing beyond the standard model particle physics and gives access to energy scales beyond the potential of future accelerators this book presents in a breathtaking manner the achievements in particle physics have been made from a nuclear physics process consisting of a 150 page highly factual overview of the field of double beta decay and a 1200 page collection of the most important original articles the book outlines the development of double beta decay research theoretical and experimental from its humble beginnings until its most recent achievements with its revolutionary consequences for the theory of particle physics it further presents an outlook on the exciting future of the field

Computational Methods in Physics and Engineering

2006

The first edition of this classic book has become the authoritative reference for physicists desiring to master the finer points of statistical data analysis this second edition contains all the important material of the first much of it unavailable from any other sources in addition many chapters have been updated with considerable new material especially in areas concerning the theory and practice of confidence intervals including the important Feldman Cousins method both frequentist and Bayesian methodologies are presented with a strong emphasis on techniques useful to physicists and other scientists in the interpretation of experimental data and comparison with scientific theories this is a valuable textbook for advanced graduate

students in the physical sciences as well as a reference for active researchers

Physics
