would have loved in my introductory proof class duc van
khanh tran has written up a fantastic way to both learn
and practice one of the most essential tools in a
mathematician s toolkit induction it s difficult to
find such a large comprehensive array of well written
and demonstrative practice problems which makes this
all the more valuable a resource duc van khanh tran
carefully pens each solution to be as intuitive and
explanatory as possible so the risk of confusion at a
solution is minimal the vast amount of problems is
complemented by the vast array of topics the book
covers inequalities sequences trigonometry power series
derivatives and integrals are only some of the concepts
found guaranteeing that anyone interested in math will
get something new out of this book i ve tried a few of
these for fun i really like the integral problems

The Implications of Induction 2019-10-30 induction in geometry discusses the application of the method of mathematical induction to the solution of geometric problems some of which are quite intricate the book contains 37 examples with detailed solutions and 40 for which only brief hints are provided most of the material requires only a background in high school algebra and plane geometry chapter six assumes some knowledge of solid geometry and the text occasionally employs formulas from trigonometry chapters are self contained so readers may omit those for which they are unprepared to provide additional background this volume incorporates the concise text the method of mathematical induction this approach introduces this technique of mathematical proof via many examples from algebra geometry and trigonometry and in greater detail than standard texts a background in high school algebra will largely suffice later problems require some knowledge of trigonometry the combination of solved problems within the text and those left for readers to work on with solutions provided at the end makes this volume especially practical for independent study

Mathematics and Plausible Reasoning, Volume 1

2020-09-01 the local justification of beliefs and hypotheses has recently become a major concern for epistemologists and philosophers of induction as such the problem of local justification is not entirely new most pragmatists had addressed themselves to it and so did to some extent many classical inductivists in the bacon whewell mill tradition in the last few decades however the use of logic and semantics probability calculus statistical methods and decision theoretic concepts in the reconstruction of in ductive inference has revealed some important technical respects in which inductive justification can be local the choice of a language with its syntactic and semantic features the relativity of probabilistic evalua tions to an initial body of evidence or background knowledge and to an agent s utilities and preferences etc some paradoxes and difficulties encountered by purely formal accounts of inductive justification the erosion of the once dominant empiricist position which most approaches to induction took for granted and the increasing challenge of noninduc tivist epistemolgies have underscored the need of accounting for the methodological problems of applying inductive logic to real life contexts particularly in science as a result in the late fifties and sixties several related developments pointed to a new local approach to inductive justification

Comprehensive Teacher Induction 2003-05-31 from the
very beginning of their investigation of human
reasoning philosophers have identified two other forms
of reasoning besides deduction which we now call
abduction and induction deduction is now fairly well
understood but abduction and induction have eluded a
similar level of understanding the papers collected
here address the relationship between abduction and
induction and their possible integration the approach
is sometimes philosophical sometimes that of pure logic
and some papers adopt the more task oriented approach
of ai the book will command the attention of
philosophers logicians ai researchers and computer
scientists in general

the papers collected in this volume were originally
presented at a symposium held at the university of
pennsylvania in december of 1968 each of the papers has
been revised in light of the discussions that took
place during this symposium none of the papers has

participated the symposium was made possible by a grant

Dynamic Induction 2016-04-29 definition is an important scientific and philosophical method in all kinds of scientific and philosophical inquiries definition is provided to make clear the characteristics of the things under investigation definition in this sense sometimes called real definition should state the essence of the thing defined according to aristotle in another currently popular sense sometimes called nominal definition definition explicates the meaning of a term already in use in an ordinary language or the scientific discourse or specifies the meaning of a new term introduced in an ordinary language of the scientific discourse definition combines the purposes of both real and nominal definition and is promoted by the nyaya philosophers of india another important method of science and philosophy is induction in a narrow sense induction is a method of generalization to all cases from the observation of particular cases in a broad sense induction is a method for reasoning from some observed fact to a different fact not involved in the former we understand induction in the broad sense though more often we shall actually be concerned with induction in the narrow sense how can our limited experience of nature provide the rational basis for making knowledge claims about unobserved phenomena

but many paradigmatic instances of induction can be justified in terms of something weaker than the principle that nature is uniform namely a form of reasoning i call inference to lesser coincidence this form of reasoning is meant to incorporate traditional formulations of the justification of induction expressed in terms of inference to the best explanation statistical sampling and bayesian reasoning my version of the argument is as follows the conditional time invariant proposition that vast regularities in progress are likely to continue somewhat further is either true or false if false then the regularities we have observed are colossally coincidental if true they are far less coincidental therefore the proposition is probably true if in fact vast regularities in progress are likely to continue this has application to specific cases such as the possibility that the sun will rise again i respond to three objections which claim that time restricted laws lessen the coincidence of observed regularities without making it likely that the sun will rise again that the sample of observed events might be biased and that a zero prior probability assignment for dependence might be justified i conclude by discussing the meaning of cause
