in the early days of the great depression the search for steady work drove thousands of migrant laborers many of whom were african american from all over appalachia to a rural area near fayetteville west virginia union carbide corporation had begun construction on a three mile tunnel to divert the new river and many hands were needed toiling for five years in confined spaces with poor ventilation no means of dust control and limited use of personal breathing protection the workers were repeatedly exposed to pure silica dust many developed silicosis an incurable and debilitating lung disease that is estimated to have caused the deaths of nearly eight hundred workers two thirds of whom were black soon after the us house of representatives committee on labor classified silicosis as an occupational hazard despite the disaster s impact information about its severity was largely suppressed a decision that ensured the event faded quickly from public memory aside from a small plaque at hawk s nest state park which inaccurately admits to only 109 victims there is little to mark the site of the worst industrial accident to date in the united states in appalachian ghost a photographic reimaging of the hawk s nest tunnel disaster author raymond thompson jr explores the possibilities of that tragedy by reviving the faces and spaces of hawk s nest using primary source materials to re create the workers experiences in photographs thompson recontextualizes archival images to present a counter archive that positions the black experience at hawk s nest within the larger story of the american labor landscape his photographs and poetry give voice to the silenced resisting revisionist narratives that often ignore the sacrifices of african americans and erase their instrumental role in the development of america s infrastructure

this thesis evaluates the viability of ferroelectric si hfo2 and its derived fefet application for non volatile data storage at the beginning the ferroelectric effect is explained briefly such that the applications that make use of it can be understood afterwards the latest findings on ferroelectric hfo2 are reviewed and their potential impact on future applications is discussed experimental data is presented afterwards focusing on the ferroelectric material characteristics of si hfo2 that are most relevant for memory applications besides others the stability of the ferroelectric switching effect could be demonstrated in a temperature range of almost 400 k moreover nanosecond switching speed and endurance in the range of 1 million to 10 billion cycles could be proven retention and imprint characteristics have furthermore been analyzed and are shown to be stable for 1000 hours bake time at 125 oc derived from the ferroelectric effect in hfo2 a 28 nm fefet memory cell is introduced as the central application of this thesis based on numerical simulations the memory concept is explained and possible routes towards an optimized fefet cell are discussed subsequently the results from electrical characterization of fefet

multi structures are presented and discussed by using si hfo2 it was possible to realize the world s first 28 nm fefet devices possessing i a 10k cycling endurance and an extrapolated 10 year data retention at room temperature the next step towards a fefet memory is represented by connecting several memory cells into matrix type configurations a cell concept study illustrates the different ways in which fefet cells can be combined together to give high density memory arrays for the proposed architectures operational schemes are theoretically discussed and analyzed by both electrical characterization of fefet multi structures and numerical simulations the thesis concludes with the electrical characterization of small fefet memory arrays first results show that a separation between memory states can be achieved by applying poling and incremental step pulse programming ispp sequences these results represent an important cornerstone for future studies on si hfo2 and its related applications
