Evaluating GDP Forecasting Models for Korea 2011-03-01 gross domestic product gdp and other statistics based on national income accounting are ubiquitous but rarely understood today gdp has been criticized for many reasons including not reflecting well being leaving out the costs of environmental pollution and not counting unpaid work but on purely economic terms it has been mostly accepted as an indicator of economic performance in recent decades however gdp has diverged dramatically from economic trends such as employment and median income this book argues that gdp is flawed even as a narrow economic indicator and traces the problem to the way financial services are measured the first part of the book is a political history of the practice of national accounting from its beginning in the mid 17th century to present day and explores how such income estimates were constructed for political reasons the financialization of gdp presents the practice of estimating national income as a historically and political contingent craft driven by power and not only theory culminating in the rise of the financial sector and the concomitant inclusion of financial services in gdp in 1993 the second part of the book focuses on the treatment of financial services in national accounting and develops an adjusted measure of output final domestic product or fdp which treats financial revenues as intermediate inputs or costs to the economy as a whole the final part of the book explores the empirical and policy implications of treating finance as an overall cost to the economy this volume shows that the great moderation of volatility was a statistical artefact okun s law relating changes in output and unemployment never died and even provides early signs for the great recession which analysts using standard gdp did not see this book is of great interest to those who study political economy and macroeconomics

The Financialization of GDP 2016-08-12 this book uses the metaphor the economy is society s metabolism as a springboard to develop a rigorous theoretical framework for a better system of national accounts which goes beyond gdp and is relevant to the age of resource depletion society is entering a new era in which biophysical limits related to natural resource extraction rates and the biosphere s waste assimilation capacity are becoming binding constraints on mature economies unfortunately the data needed for policy makers to understand and manage economic growth in this new era are not universally available all stakeholders need a new way to understand our economy in the context of the biosphere s ability to provide essential natural capital and we suggest that detailed information about materials energy embodied energy and energy intensity should be routinely gathered analyzed and disseminated from a centralized location to provide markets and policymakers with a more comprehensive understanding of the biophysical economy however a firm theoretical foundation is needed before proceeding along this new path which this book is intended to provide after arguing that the stock of manufactured capital is an important driver of material and energy demands imposed upon the biosphere a new accounting framework is derived from the laws of thermodynamics to reflect the fact that material and embodied energy accumulate within the capital stock of economic sectors this framework extends the energy input output ei o techniques first developed by bullard herendeen and others to estimate energy intensity of economic products implications from the new framework are discussed including the value of economic metrics for policy making the need for physically based rather than product based ei o formulations a re assessment of the concept of economic growth and an evaluation of recycling reuse and dematerialization the framework also provides an opportunity to assess an array of definitions for daly s steady state economy in relation to the ideal of a sustainable economy the book ends with a list of steps to be taken in creating a more comprehensive system of national accounts national accounting agencies worldwide should develop and maintain balance sheets of both natural and manufactured capital in addition to national income statements all stocks and inter sector flows should be provided in physical as well as financial units in the us the bureau for economic analysis bea should restart detailed capital labor energy material and services klems reporting national accounting agencies should routinely estimate the energy intensity of economic products and all of the above should be estimated and disseminated on an annual basis

Beyond GDP 2013-05-09 we provide a comprehensive analysis of the relationship between greenhouse gas ghg emissions and gdp in china using both aggregate and provincial data the kuznets elasticity is about 0.6 for china higher than that in advanced countries but below that of major emerging markets the elasticity is somewhat lower for consumption based emissions than for production based emissions providing mild evidence consistent with the pollution haven hypothesis the kuznets elasticity is much lower for the last three decades than for the three previous decades suggesting a longer term trend toward decoupling as china has become richer further evidence of this comes from provincial data richer provinces tend to have smaller kuznets elasticities than poorer ones in addition to the trend relationship we find that the environmental okun's law holds in china

2005 Year Book Australia 2011-10-25 we develop a simple model to examine the conditions under which delaying fiscal consolidation can affect the present value of gdp via the fiscal stance s effects on the output gap and hysteresis we find that the absolute size of the fiscal multiplier the focus of much empirical investigation and policy debate is likely inconsequential in this regard rather what matters is the degree to which the multiplier during the initial period of fiscal stimulus differs from the multiplier when the stimulus is withdrawn if the multiplier is constant over time delaying consolidation is unlikely to significantly boost the present value of gdp via effects on the output gap and hysteresis the potential success of such efforts relies instead on exploiting time variation in multipliers
