Space-Time Methods 2019-09-23

this volume provides an introduction to modern space time discretization methods such as finite and boundary elements and isogeometric analysis for time dependent initial boundary value problems of parabolic and hyperbolic type particular focus is given on stable formulations error estimates adaptivity in space and time efficient solution algorithms parallelization of the solution pipeline and applications in science and engineering

Modular Units 2013-06-29

in the present book we have put together the basic theory of the units and cuspidal divisor class group in the modular function fields developed over the past few years let i be the upper half plane and n a positive integer let Γ_n be the subgroup of $SL(2, \mathbb{Z})$ consisting of those matrices $\begin{pmatrix} a & b \\ c & d \end{pmatrix}$ with $a, d \equiv 1 \pmod{n}$ and $b, c \equiv 0 \pmod{n}$ then \mathbb{C}/Γ_n is complex analytic isomorphic to an affine curve Y_n whose compactification is called the modular curve X_n the affine ring of regular functions on Y_n over \mathbb{C} is the integral closure of $\mathbb{C}[j]$ in the function field of X_n over \mathbb{C} here j is the classical modular function however for arithmetic applications one considers the curve as defined over the cyclotomic field $\mathbb{Q}(\zeta_n)$ of n th roots of unity and one takes the integral closure either of $\mathbb{Q}[j]$ or $\mathbb{Z}[j]$ depending on how much arithmetic one wants to throw in the units in these rings consist of those modular functions which have no zeros or poles in the upper half plane the points of X_n which lie at infinity that is which do not correspond to points on the above affine set are called the cusps because of the way they look in a fundamental domain in the upper half plane they generate a subgroup of the divisor class group which turns out to be finite and is called the cuspidal divisor class group

Tōkyō Gakugei Daigaku kiyō 1976

this book presents the notes from the seminar on wave phenomena given in 2019 at the mathematical research center in oberwolfach the research on wave type problems is a fascinating and emerging field in mathematical research with many challenging applications in sciences and engineering profound investigations on waves require a strong interaction of several mathematical disciplines including functional analysis partial differential equations mathematical modeling mathematical physics numerical analysis and scientific computing the goal of this book is to present a comprehensive introduction to the research on wave phenomena starting with basic models for acoustic elastic and electro magnetic waves topics such as the existence of solutions for linear and some nonlinear material laws efficient discretizations and solution methods in space and time and the application to inverse parameter identification problems are covered the aim of this book is to intertwine analysis and numerical mathematics for wave type problems promoting thus cooperative research projects in this field

the required background is surveyed and there is an extensive development of methods of approximation and computational algorithms the book is written on two levels algorithms and applications and mathematical proofs thus the ideas should be very accessible to a broad audience book jacket

Survey of Food and Nutrition Research in the United States, 1948-1949 1950

this book is concerned with numerical methods for stochastic control and optimal stochastic control problems the random process

models of the controlled or uncontrolled stochastic systems are either diffusions or jump diffusions stochastic control is a very active area of research and new problem formulations and sometimes surprising applications appear regularly we have chosen forms of the models which cover the great bulk of the formulations of the continuous time stochastic control problems which have appeared to date the standard formats are covered but much emphasis is given to the newer and less well known formulations the controlled process might be either stopped or absorbed on leaving a constraint set or upon first hitting a target set or it might be reflected or projected from the boundary of a constraining set in some of the more recent applications of the reflecting boundary problem for example the so called heavy traffic approximation problems the directions of reflection are actually discontinuous in general the control might be representable as a bounded function or it might be of the so called impulsive or singular control types both the drift and the variance might be controlled the cost functions might be any of the standard types discounted stopped on first exit from a set finite time optimal stopping average cost per unit time over the infinite time interval and so forth

over the last 25 years reading processes have been the focus of an enormous amount of research in experimental psychology as well as in other disciplines the theories and models emerging from this research have greatly advanced understanding of both normal acquisition and of reading disabilities although great progress has been made there are certain aspects that have been relatively neglected in the current understanding specifically the role of visual factors has received less attention than that of other component processes this is particularly surprising since reading and writing are distinct from the other language processes of speaking and listening in large part by virtue of the fact that a visual dimension is involved relevant research is broadly scattered both geographically and in terms of disciplines and there have been no major reviews or books concerned with the visual dimension of reading and reading disabilities the purpose of this book is to bring together a broad range of evidence that concerns the role of visual information in reading and reading disabilities because reading processes are of central interest to cognitive scientists neuropsychologists psycholinguists clinicians and educators this book should draw a very broad readership
