jens hetland teimuraz gochitashvili in contrast to oil natural gas is usually routed through pipeline systems stretched from the wellhead to the end user although liquefied natural gas lng is gaining increased interest the commercialisation of natural gas fields is inherently linked to rigid transportation systems that require huge investments in tangible assets fixed to specific locations the supply of natural gas is constrained by the transportation system and requires access to appropriate infrastructure for transport and distribution the trading of natural gas is traditionally associated with long term contracts albeit the duration per se of gas transport contracts appears to be less important after the deregulation of the energy markets as diversification is strategically important to modern societies the security of energy supplies becomes an inherent issue in order to avoid situations of shortage and to keep the price level stable industrial nations are paying attention to the security of energy supplies in brief terms this means that having more than one supplier of natural gas and more than one transport route would be strategically important this also affects political issues and international law and regulations economics science and technology the purpose of this book is to address opportunities extended from science and research pertaining to the exploitation and international trading of natural gas that involves transit countries this especially relates to the transport and handling of gas from remote regions and pipelines that are

natural gas purchasing is generally deregulated on a federal or interstate basis however intrastate there are many conditions that come into play which typically translate into higher costs for the commercial or industrial user this book is intended to serve as comprehensive reference which can be used by the natural gas purchaser to sort out both the potential pitfalls that can negatively impact gas costs and the opportunities for significant savings available to the informed user each step in the process of natural gas production and delivery to the marketplace is thoroughly examined including production inter intrastate transportation regulation cost factors local distribution company structures and deregulation processes also fully covered is the natural gas ldc billing process and how understanding it can lead to significant savings

the transportation sector cannot continue on its current path the volatility of oil prices threatens the u s economy the large proportion of oil importation threatens u s energy security and the massive contribution of greenhouse gases threatens the environment the development of domestic sources of alternative transportation fuels with lower greenhouse emissions is now a national imperative coal and biomass are in abundant supply in the united states and can be converted to liquid fuels that can be combusted in existing and future vehicles their abundant supply makes them attractive candidates to provide non oil based liquid fuels to the u s transportation system however there are important questions about the economic viability carbon impact and technology status of these options liquid transportation fuels from coal and biomass provides a snapshot of the potential costs of liquid fuels from biomass by biochemical conversion and from biomass and coal by thermochemical conversion policy makers investors leaders in industry the transportation sector and others with a concern for the environment economy and energy security will look to this book as a roadmap to independence from foreign oil with immediate action and sustained effort alternative liquid fuels can be available in the 2020 time frame if or when the nation needs them

in this thesis the major differences between underground hydrogen storage and the conventional storage of natural gas are lined out to be bio reactive and gas mixing phenomena a

new mathematical model was developed to describe the coupling between two phase flow and microbial populations which consume hydrogen for their metabolism different analytical and numerical techniques were applied to investigate the storage of hydrogen in the geological subsurface an analytical solution was derived for gravity driven multi component two phase flow in heterogeneous porous media oscillating scenarios similar to turing instability were detected storage scenarios were simulated including a field scale demonstration in a realistic geological model
