the increasing presence of mobile robots in our everyday lives introduces the requirements for their intelligent and autonomous features therefore the next generation of mobile robots should be more self capable in respect to increasing of their functionality in unforeseen situations decreasing of the human involvement in their everyday operations and their maintenance being robust fault tolerant and reliable in their operation although mobile robotic systems have been a topic of research for decades and aside the technology improvements nowadays the subject on how to program and making them more autonomous in their operations is still an open field for research applying bio inspired organic approaches in robotics domain is one of the methodologies that are considered that would help on making the robots more autonomous and self capable i e having properties such as self reconfiguration self adaptation self

optimization etc in this book several novel biologically inspired approaches for walking robots multi legged and humanoid domain are introduced and elaborated they are related to self organized and self stabilized robot walking anomaly detection within robot systems using self adaptation and mitigating the faulty robot conditions by self reconfiguration of a multi legged walking robot the approaches presented have been practically evaluated in various test scenarios the results from the experiments are discussed in details and their practical usefulness is validated

Science, Politics, Stem Cells And Genes: California's War On Chronic Disease

every time a cell divides a copy of its genomic dna has to be faithfully copied to generate new genomic dna for the daughter cells the process of dna replication needs to be precisely regulated to ensure that replication of the genome is complete and accurate but that re replication does not occur errors in dna replication can lead to genome instability and cancer the process of replication initiation is of paramount importance because once the cell is committed to replicate dna it must finish this process a great deal of progress has been made in understanding how dna replication is initiated in eukaryotic cells in the past ten years but this is the first one source book on these findings the initiation of dna replication in eukaryotes will focus on how dna replication is initiated in eukaryotic cells while the concept of replication initiation is simple its elaborate regulation and integration with other cell processes results in a high level of complexity this book will cover how the position of replication initiation is chosen

how replication initiation is integrated with the phases of the cell cycle and how it is regulated in the case of damage to dna it is the cellular protein machinery that enables replication initiation to be activated and regulated we now have an in depth understanding of how cellular proteins work together to start dna replication and this new resource will reveal a mechanistic description of dna replication initiation as well

it is fair to say that embryonic stem es cells have taken their place beside the human genome project as one of the most discussed

biomedical issues of the day it also seems certain that as this millennium unfolds we will see an increase in scientific and ethical debate about their potential utility in society on the scientific front it is clear that work on es cells has already generated new possibilities and stimulated development of new strategies for increasing our understanding of cell lineages and differentiation it is not naïve to think that within a decade or so our overall understanding of stem cell biology will be as revolutionized as it was when the pioneering hemopoietic stem cell studies of till and mcculloch in toronto captured our imaginations in 1961 with it will come better methods for es and lineage specific stem cell identification maintenance and controlled fate selection clearly es cell models are already providing opportunities for the establishment of limitless sources of specific cell populations in recognition of the growing excitement and potential of es cells as models for both the advancement of basic science and future clinical applications i felt it timely to edit this collection of protocols embryonic stem cells in which forefront investigators would provide detailed methods for use of es cells to study various lineages and tissue types

adult stem cells are responsible for tissue regeneration and repair throughout life their quiescence or activation are tightly regulated by common signalling pathways that often recapitulate those happening during embryonic development and thus it is important to understand their regulation not only in postnatal life but also during foetal development in this regard skeletal muscle is an interesting tissue since it accounts for a large percentage of body mass about 40 it is highly amenable to intervention through exercise and it is also key in metabolic and physiological changes underlying frailty susceptibility in the elderly while muscle resident satellite cells are responsible for all myogenic activity in physiological conditions and become senescent in old age other progenitor cells such as mesoangioblasts do seem to contribute to muscle regeneration and repair after tissue damage similarly fibro adipogenic precursor cells seem to be key in the aberrant response that fills up the space left from atrophied muscle mass and which ends up with a dysfunctional muscle having vast areas of fatty infiltration and fibrosis the complex interplay between these stem

progenitor cell types and their niches in normal and pathological conditions throughout life are the subjects of intense investigation this ebook highlights recent developments on the role of stem cells in skeletal muscle function both in prenatal and postnatal life and their regulation by transcriptional post transcriptional and epigenetic mechanisms additionally it includes articles on interventions associated with exercise pathological changes in neuromuscular diseases and stem cell aging

stem cells characterized by the ability to both self renew and to generate differentiated functional cell types have been derived from the embryo and from various sources of the postnatal animals and human the recent advances in stem cell research have led to a better understanding of self renewal maintenance and differentiation of both embryonic and somatic stem cells this has significantly increased our knowledge of cellular and developmental biology in general and will certainly continue to do so for a long time to come moreover given their role in maintaining and replenishing tissues stem cells represent a potential means of restoring tissue function and thereby treating the root cause of degenerative disease therefore in parallel we need to improve our cognizance of the challenges involved in applying stem cells in clinical settings the current chapters highlight both of these aspects that of understanding the actual and that of

developing the possible in recognition of the growing excitement and potential of stem cells as models for both the advancement of basic science and future clinical applications i felt it timely to edit this book in which forefront investigators would provide new findings for the use of stem cells to study various lineages and tissue types and some applications

when starting petacrunch an ai powered media company which focuses on interviewing founders ceos and senior executives about their work and how it all started we didn t know the level of attention we would get after three months of running it online we have been

literally flooded with emails having days with over a thousand messages sent to different recipients crazy but it was worth it we have interviewed over 800 companies so far started a newsletter and built some amazing tools along the way but primarily we've learned a lot from all the stories that were shared with us some were very personal and touching some motivating or highlighting an interesting aspect of being an entrepreneur it's amazing how diverse founders are there's no common trait apart from two patience and persistence businesses rarely take off in the very first year they need time to start carving their niche in the market understanding how to grow a business from 0 to 100 is what motivated us in the first place to start petacrunch that's why we've decided to put together our very first book because we truly believe that you can learn a lot by reading about how others started and grew their businesses

this book reviews the respiratory function of vertebrate red cells i have defined the phrase respiratory function broadly to include in addition to the actual oxygen and carbon dioxide transport erythropoiesis haemoglobin synthesis red cell structure the deformability of red cells in circulation ion and substrate transport across the cell membrane cellular

metabolism and control of cellular volume and pH all of these aspects of the red cell function may affect gas transport between the respiratory epithelia and the tissues throughout the book i have tried to relate our current knowledge about the nucleated red cell function to the wealth of information about the function of mammalian red cells however whenever possible i have placed the emphasis on the nucleated red cell function for two reasons first the erythrocytes of 90 of vertebrate species are nucleated and second nucleated red cell function has not been reviewed earlier in a single volume this being the case i have tried to make the reference list as complete as i could with regard to nucleated red cells i hope that the approach adopted is useful for both comparative and human physiologists many people have contributed to the making of this book directly or indirectly antti soivio started me in this field prof henrik wallgren has always encouraged fresh scientific ideas in his department my present ideas of red cell function have been influenced by work carried out with prof roy e

of the two disciplines in parallel development for two decades tumor immunology and transplantation immunology the latter has thrived and has led to some of the most critical discoveries in immunobiology the former continues to thwart both scientists and clinicians alike the goal of immunologists in modern day research is to develop a simple and effective means to manipulate cancer in vivo possibly encompassing several venues identifying a phenotypic marker and the use of either active or passive immunization include

the use of passive reagents carrying warheads to selectively destroy cancer cells or altering the basic process of cell survival this excellent multidiscipline authored volume presents a theme which has not been well described before the papers include both basic and clinical science and range from sophisticated molecular biology to little more than phenomenology e g the increased association of cancer in some autoimmune diseases and increased presentation of autoimmune phenomena in malignant condition this however is state of the art this collection of themes will be of use not only to bench scientists but also to clinicians who treat patients the book represents progress at the cutting edge of this discipline and points the way to further developments in the black box of immunology

this book provides a resource of current understandings about various aspects of the biology of spermatogonia in mammals considering that covering the entire gamut of

all things spermatogonia is a difficult task specific topics were selected to provide foundational information that will be useful for seasoned researchers in the field of germ cell biology as well as investigators entering the area looking to the future the editors predict that the foundational information provided in this book combined with the advent of new tools and budding interests in use of non rodent mammalian models will produce another major advance in knowledge regarding the biology of spermatogonia over the next decade in particular we anticipate that the core molecular machinery driving different spermatogonial states in most if not all mammals will be described fully the extrinsic signals emanating from somatic support cell populations to influence spermatogonial functions will become fully known and the capacity to derive long term cultures of sscs and transplant the population to regenerate spermatogenesis and fertility will become a reality for higher order mammals
