the introductory statistics course presents serious pedagogical problems to the instructor for the great majority of students the course represents the only formal contact with statistical thinking that he or she will have in college students come from many different fields of study and a large number suffer from math anxiety thus an instructor who is willing to settle for some limited objectives will have a much better chance of success than an instructor who aims for a broad exposure to statistics many statisticians agree that the primary objective of the introductory statistics course is to introduce students to variability and uncertainty and how to cope with them when drawing inferences from observed data addi tionally the introductory course should enable students to handle a limited number of useful statistical techniques the present text which is the successor to the author's introduction to statistics a nonparametric approach houghton mifflin company boston 1976 tries to meet these objectives by introducing the student to the ba sic ideas of estimation and hypothesis testing early in the course after a rather brief introduction to data organization and some simple ideas about probability estimation and hypothesis testing are discussed in terms of the two sample problem which is both conceptually simpler and more realistic than the one sample problem that customarily serves as the basis for the discussion of statistical inference

the bankruptcy abuse prevention and consumer protection act of 2005 bapcpa limited the types and quantities of exempt household goods on which debtors could avoid certain liens part of the motivation for these changes was a perception that debtors were using their household goods as collateral to obtain loans that they never intended to repay the executive office for u s trustees eoust asked the rand corporation to analyze the similarities and differences in the amounts and types of loans secured by debtors household goods reported in bankruptcy cases filed before and after bapcpa rand found no changes in debtor or creditor behavior due to the new definition of household goods some interview participants noted that it may be too early to tell whether debtors are changing their practices related to this issue

as spinning is still involved in around 60 of all aircraft accidents bfu 1985 and belcastro 2009 this aerodynamic phenomenon is still not fully understood as u s and european certification specifications do not require recoveries from fully developed spins of normal category aeroplanes certification test flights will not discover aeroplane mass and centre of gravity combinations which may result in unrecoverable spins this book aims to contribute to a better understanding of the spin phenomenon through investigating the spin regime for normal utility and aerobatic aircraft and to explain what happens to the aircraft in terms of

the aerodynamics flight mechanics and the aircraft stability the approach used is to vary the main geometric parameters such as the centre of gravity position and the aeroplane s mass across the flight envelope and to investigate the subsequent effect on the main spin characteristic parameters such as the angle of attack pitch angle sideslip angle rotational rates and recovery time first of all a literature review sums up the range of technical aspects that affect the problem of spinning it reviews the experimental measurement techniques used theoretical methods developed and flight test results obtained by previous researchers the published results have been studied to extract the effect on spinning of aircraft geometry control surface effectiveness flight operational parameters and atmospheric effects consideration is also made of the influence on human performance of spinning the current spin regulations and the available training material for pilots a conventional geometry single engine low wing aeroplane the basic trainer fuji fa 200 160 has been instrumented with a proven digital flight measurement system and 27 spins have been systematically conducted inside and outside the certified flight envelope the accuracy of the flight measurements is ensured through effective calibration and the choice of sensors has varied through the study with earlier sensors suffering from more drift than the current sensors belcastro 2009 and schrader 2013 in flight parameter data collected includes left and right wing α and β angles roll pitch yaw angles and corresponding rates all control surface deflections vertical speeds altitude losses and the aeroplane s accelerations in all three directions such data have been statistically analysed the pitch behaviour has been mathematically modelled on the basis of the gathered flight test data nine observations have been proposed these mainly cover the effects of centre of gravity and aircraft mass variations on spin characteristic behaviour they have all been proven as true through the results of this thesis the final observation concerns the generalisation of the fuji results to the spin behaviour of other aircraft in the same category these observations can be used to improve flight test programmes aircraft design processes flight training materials and hence contribute strongly to better flight safety
