updates for many countries have made it possible to estimate hunger in the world with greater accuracy this year in particular newly accessible data enabled the revision of the entire series of undernourishment estimates for china back to 2000 resulting in a substantial downward shift of the series of the number of undernourished in the world nevertheless the revision confirms the trend reported in past editions the number of people affected by hunger globally has been slowly on the rise since 2014 the report also shows that the burden of malnutrition in all its forms continues to be a challenge there has been some progress for child stunting low birthweight and exclusive breastfeeding but at a pace that is still too slow childhood overweight is not improving and adult obesity is on the rise in all regions the report complements the usual assessment of food security and nutrition with projections of what the world may look like in 2030 if trends of the last decade continue projections show that the world is not on track to achieve zero hunger by 2030 and despite some progress most indicators are also not on track to meet global nutrition targets the food security and nutritional status of the most vulnerable population groups is likely to deteriorate further due to the health and socio economic impacts of the covid 19 pandemic the report puts a spotlight on diet quality as a critical link between food security and nutrition meeting sdg 2 targets will only be possible if people have enough food to eat and if what they are eating is nutritious and affordable the report also introduces new analysis of the cost and affordability of healthy diets around the world by region and in different development contexts it presents valuations of the health and climate change costs associated with current food consumption patterns as well as the potential cost savings if food consumption patterns were to shift towards healthy diets that include sustainability considerations the report then concludes with a discussion of the policies and strategies to transform food systems to ensure affordable healthy diets as part of the required efforts to end both hunger and all forms of malnutrition

*Journal* 1948 it is quite common in a randomized clinical trial rct to encounter patients who do not comply with their assigned treatment since noncompliance often occurs non randomly the commonly used approaches including both the as treated at and as protocol ap analysis and the intent to treat itt or as randomized analysis are all well known to possibly produce a biased inference of the treatment efficacy this book provides a systematic and organized approach to analyzing data for rcts with noncompliance under the most frequently encountered situations these include parallel sampling stratified sampling cluster sampling parallel sampling with subsequent missing outcomes and a series of dependent bernoulli sampling for repeated measurements the author provides a comprehensive approach by using contingency tables to illustrate the latent probability structure of observed data using real life examples computer simulated data and exercises in each chapter the book illustrates the underlying

theory in an accessible and easy to understand way key features consort flow diagrams and numerical examples are used to illustrate the bias of commonly used approaches such as at analysis ap analysis and itt analysis for a rct with noncompliance real life examples are used throughout the book to explain the practical usefulness of test procedures and estimators each chapter is self contained allowing the book to be used as a reference source includes sas programs which can be easily modified in calculating the required sample size biostatisticians clinicians researchers and data analysts working in pharmaceutical industries will benefit from this book this text can also be used as supplemental material for a course focusing on clinical statistics or experimental trials in epidemiology psychology and sociology
