Blumgart's Surgery of the Liver, Pancreas and Biliary Tract E-Book 2013-06-21

in the past liver resections and liver transplantations were performed by different surgical teams with very little interplay between the two however the evolution toward more complex

operations called for an increasingly intense interaction between these surgical techniques split liver and living donor liver transplantation have become popular in the transplant community utilizing the coinaud segmental anatomy in a very sophisticated way while portal and arterial resection and reconstruction have become indispensable methods for treating klatskin tumors infiltrating the hepatic hilum this book offers a complete overview of the connections between liver transplantation and hepatobiliary surgery it focuses on ex situ techniques for resection of tumors at the suprahepatic confluence with or without venous reconstruction and on total vascular exclusion of the liver with the aid of a venovenous bypass that should be a surgical option for referral centers in hepatopancreatobiliary surgery by taking into consideration the development of minimally invasive liver surgery it will introduce readers to a variety of new perspectives such as vascular exclusion techniques with or without extracorporeal circulation hemodynamic implications and lessons learned from liver transplant surgery and technical details on pediatric transplantation and its informative role in modern biliary tract surgery

Liver Neoplasms—Advances in Research and Treatment: 2013 Edition 1977-07

hypothermia was first applied to the human in 1940 by smith and fay in an attempt to affect the growth of malignant tumours and found its most important application firstly in open cardiac surgery and latterly in neurosurgery the first results regarding the use of hypothermia in neurosurgery were reported at the first inter national congress of neurological sciences held in brussels in 1957 the same subject was again considered at the annual meeting of the societe de neurochirurgie de langue franl aise held in montpellier in 1962 when i was charged with the task of organizing the symposium at the second european congress of neurosurgery i thought it ad visable to put forward again the problem of the use of hypothermia in neurosurgery though this procedure had rapidly become popular and a mass of publications from the most important neurosurgical centres of the world had appeared many problems remained un solved and in particular those related to the choice of cases to be treated the usefulness of the procedure and its possible dangers

therapeutic hypothermia has emerged as a very important treatment option for patients with cardiac arrest as it provides significant protection from developing neurologic injury once the patient has been successfully resuscitated studies have demonstrated over 15 absolute risk reduction in death and neurologic injury using this therapy although hospitals and medical centers have become familiar with this important intervention it still remains greatly under utilized due to an experience and lack of resources to safely and effectively deploy such a program the objective of this book is to educate and familiarize both providers and institutions as to how to develop and deploy and provide therapeutic hypothermia to their patients the current knowledge for this is provided by speakers and national experts and also by literature review there are several courses being provided on this as well throughout the us these are good venues for people to come and see and get hands on experience but there still needs to be a concrete book with references on how to go about getting this program started
