The Dynamics of Science and Technology 1978-05-31

for many years safety technology has constituted the essential instrument for the prevention of accidents as a direct result of handling new technology its awareness of the interactions

prevalent in natural science causes safety technology to act on the basis of actual accidents and it utilizes to their fullest extent any means provided by the engineering sciences man proceeds in a general direction towards preservation and improvement thus working towards the optimization of the technical design however a new set of basic problems presented itself the moment new large scale technologies were introduced into the areas of processing energy and traffic thereby creating a considerable amount of additional danger potential this also signified the end of an era when safety technology could be practiced chiefly on the basis of accident statistics for ethical reasons it became necessary that a credible prognosis as to the type and effect of accidents took the place or at least supplemented the hitherto practiced purely reactive methods the realization that the available means of safety technology were no longer sufficient in a highly technologized environment spurred the demand for entirely new concepts which would eventually lead to a higher degree of safety a decisive step had to be taken away from a purely technical approach and towards and all encompassing look at accident systems because man had become aware of the fact that accidents will always be a part of the interaction between man technology and environment
