sir cyril taylor has been at the heart of english education for over two decades serving as an adviser to ten successive uk education secretaries and four prime ministers both conservative and labour including margaret thatcher and tony blair his passion for education has led directly to real school improvement from the creation of city technology colleges to specialist schools and academies which together now constitute over nine in ten secondary schools in england the specialist schools and academies trust the body he founded is now a leading force in school improvement

worldwide a good school for every child draws on that wealth of experience while offering an insider s look at some of the key challenges in education it is also an invaluable guide for parents and teachers interested in how our schools work today there is a particular focus on how to raise standards in low attaining schools improving levels of literacy and numeracy and teaching our children the skills they need for the 21st century this book is also a clarion call to our political leaders about the challenges that still remain the education of children in care the failure to stretch able youngsters and the problems recruiting enough good science teachers education is more open today than ever before with league tables and inspection reports yet for many outsiders it can seem a world clouded by its own language and rituals cyril taylor opens the door to that world through stories of inspirational headteachers and successful schools by doing so he offers a vision that is both instructive and inspirational one that shows how schools working with parents and the wider community can raise the standards of achievement for all their pupils

at a time when more and more of what people learn both in formal courses and in everyday life is mediated by technology learning online provides a much needed guide to different forms and applications of online learning this book describes how online learning is being used in both k 12 and higher education settings as well as in learning outside of school particular online learning technologies such as moocs massive open online courses multi player games learning analytics and adaptive online practice environments are

described in terms of design principles implementation and contexts of use learning online synthesizes research findings on the effectiveness of different types of online learning but a major message of the book is that student outcomes arise from the joint influence of implementation context and learner characteristics interacting with technology not from technology alone the book describes available research about how best to implement different forms of online learning for specific kinds of students subject areas and contexts building on available evidence regarding practices that make online and blended learning more effective in different contexts learning online draws implications for institutional and state policies that would promote judicious uses of online learning and effective implementation models this in depth research work concludes with a call for an online learning implementation research agenda combining education institutions and research partners in a collaborative effort to generate and share evidence on effective practices

this book discusses uncertain threats which are caused by unknown attacks based on unknown vulnerabilities or backdoors in the information system or control devices and software hardware generalized robustness control architecture and the mimic defense mechanisms are presented in this book which could change the easy to attack and difficult to defend game in cyberspace the endogenous

uncertain effects from the targets of the software hardware based on this architecture can produce magic mimic defense fog and suppress in a normalized mode random disturbances caused by physical or logic elements as well as effects of non probability disturbances brought by uncertain security threats although progress has been made in the current security defense theories in cyberspace and various types of security technologies have come into being the effectiveness of such theories and technologies often depends on the scale of the prior knowledge of the attackers on the part of the defender and on the acquired real timing and accuracy regarding the attackers behavior features and other information hence there lacks an efficient active defense means to deal with uncertain security threats from the unknown even if the bottom line defense technologies such as encrypted verification are adopted the security of hardware software products cannot be quantitatively designed verified or measured due to the loose coupling relationship and border defense modes between the defender and the protected target there exist insurmountable theoretical and technological challenges in the protection of the defender and the target against the utilization of internal vulnerabilities or backdoors as well as in dealing with attack scenarios based on backdoor activated collaboration from both inside and outside no matter how augmented or accumulated protective measures are adopted therefore it is urgent to jump out of the stereotyped thinking based on conventional defense theories and technologies find new theories and methods to effectively reduce the utilization of vulnerabilities and backdoors of the targets without relying on the priori knowledge and feature

information and to develop new technological means to offset uncertain threats based on unknown vulnerabilities and backdoors from an innovative perspective this book provides a solution both in theory and engineering implementation to the difficult problem of how to avoid the uncontrollability of product security caused by globalized marketing cots and non trustworthy software hardware sources it has been proved that this revolutionary enabling technology has endowed software hardware products in it ict cps with endogenous security functions and has overturned the attack theories and methods based on hardware software design defects or resident malicious codes this book is designed for educators theoretical and technological researchers in cyber security and autonomous control and for business technicians who are engaged in the research on developing a new generation of software hardware products by using endogenous security enabling technologies and for other product users postgraduates in it ict cps ics will discover that as long as the law of structure determines the nature and architecture determines the security is properly used the problem of software hardware design defects or malicious code embedding will become the swelling of achilles in the process of informationization and will no longer haunt pandora s box in cyberspace security and opening up advanced progressiveness and controllability seem to be contradictory but there can be theoretically and technologically unified solutions to the problem

around the turn of the millennium it had become painfully evident that development aid charity or global business as usual were not going to be the mechanisms to alleviate global poverty today there is little dispute that poverty remains the most pressing global problem calling for innovative solutions one recent strategy is the base of the pyramid bop concept developed by prahalad and hart which relies on entrepreneurial activity tapping into the previously ignored markets of the economically most disadvantaged it is a process requiring innovations in several disciplines technological social and business this book covers a number of areas first much of the current bop discussion emphasises targeting products to the needs of the poor but do we

actually know what the real needs of the poor are this book takes a bottom up human centred approach and examines examples that truly engage the poor in bop product and service development what types of needs assessment methodologies are indicated considering the cultural differences in bop countries are the existing methodologies adequate do they need to be redefined and redeveloped second the book considers how we can balance poverty alleviation and stimulate economic growth without stressing the ecosystem tragically the poor are hardest hit by the adverse effects of environmental deterioration such as water shortages climate change or the destruction of habitats while the economic welfare of the poor is critical the bop approach must balance its inherent paradox of encouraging greater consumption while avoiding further pressures on environmental sustainability the link between the bop approach and sustainable development is a key feature of this book third it looks at innovation and asks what kinds of bottom up innovation open source technological social and business support bop initiatives and sustainable development fourth the book deals with the relationship between development assistance and bop is a bop strategy the antithesis to development aid or can these two co exist or even complement each other finally the book raises questions about the relationship between corporate responsibility and bop is bop a new form of corporate neo colonialism or a new form of corporate responsibility although the bop concept has unleashed an extensive and generally enthusiastic response from academics businesses ngos and governments the knowledge domain around this concept is still in the early stages of development this book

addresses that need with a focus on the needs of the end users the poor as a starting point for bop products and innovations with contributions from both supporters and critics it provides a treasure trove of global knowledge on how the concept has developed what its successes and failures have been and what promise it holds as a long term strategy for alleviating poverty and tackling global sustainability
