fossil fuels still need to meet the growing demand of
global economic development yet they are often
considered as one of the main sources of the co₂
release in the atmosphere co₂ which is the primary
greenhouse gas ghg is periodically exchanged among
the land surface ocean and atmosphere where various
creatures absorb and produce it daily however the
balanced processes of producing and consuming the
co₂ by nature are unfortunately faced by the
anthropogenic release of co₂ decreasing the emissions
of these greenhouse gases is becoming more urgent
therefore carbon sequestration and storage css of co₂

its utilization in oil recovery as well as its conversion into fuels and chemicals emerge as active options and potential strategies to mitigate co2 emissions and climate change energy crises and challenges in the storage of energy
