encyclopedia of the world's biomes is a unique five volume reference that provides a global synthesis of biomes including the latest science all of the book's chapters follow a common thematic order that spans biodiversity importance principal anthropogenic stressors and trends changing climatic conditions and conservation strategies for maintaining biomes in an increasingly human dominated world this work is a one stop shop that gives users access to up to date informative articles that go deeper in content than any currently available publication offers students and researchers a one stop shop for information currently only available in scattered or non technical sources authored and edited by top scientists in the field concisely written to guide the reader though the topic includes meaningful illustrations and suggests further reading for those needing more specific information

from a general point of view the importance of striving to minimize environmental disturbances on the continental shelf cannot be overemphasized coastal areas are sites of population centers navigation and recreation activities and source development all of which contribute to environmental stress on the shelf proper management of the shelf for optimum use requires a thorough understanding of shelf processes complex problems such as the influence of hydrodynamics on sediment dispersal element differentiation and migration physiochemical changes at the sediment water interface the relationship between the pollutants and sediments and the type of substrate with regard to benthic community and or man made structures require a multidisciplinary approach to their solution the present study interrelates meteorologic hydrographic sedimentologic and geochemical parameters to derive specific environments on the alaskan shelf these observations are then related to geologic principles in an effort to elucidate the sedimentary processes and elemental migration on the shelf attempts have also been made to relate the sediment texture to the geochemistry of the sediments obviously the chemistry is complicated as a result of biogenic contributions and variable provenance however to some extent elemental differentiation accompanies textural differentiation in sediments the distribution of elements in various phases of crustal source rocks is generally interpreted on the basis of crystallographic concepts especially the concept of isomorphism

soil science in the netherlands puts strong emphasis on the relationship between parent material and soil formation and between physiographic conditions and land use this approach developed by the late professor dr c h edelman 1903 1964 is quite understandable in a country where soils have to a great extent developed from alluvial and aeolian materials of recent geological origin dutch soil scientists have paid much attention to pedogenesis in fresh sediments known as initial soil formation or ripening and to groundwater as a soil forming factor furthermore human influence on soil genesis in this land of man made soils has been thoroughly investigated major soils and soil

regions in the netherlands clearly reflects these specific features of soils work in this country in his book mr h de bakker head of the soil classification section of the netherlands soil survey institute stichting voor bodemkartering addresses the special interests of foreign soil scientists and of students of earth sciences the author examines representative soil profiles not only with respect to the netherlands system of soil classification of which he is the co author but also in terms of some of the major classification systems used in other countries it appears that a well characterized soil profile may find a very different place in various classifications and that even for a trained specialist it is often difficult to arrive at a specific determination within a given system

in situ produced cosmogenic nuclides can provide chronologies of environmental change over the past few thousand to several millions of years and may be used to quantify a wide range of weathering and sediment transport processes these nuclides are thus now used across a broad spectrum of earth science disciplines including paleoclimatology geomorphology and active tectonics this book is organized around sections that focus on specific aspects of the utilization of cosmogenic nuclides in earth sciences 1 development of new methods for application of in situ produced cosmogenic nuclides burial dating methods extending their utilization to carbonate rich and mafic environments 2 glacial geology laurentide ice sheet northern alps 3 active tectonics focusing on applications to constrain slip rates of active faults in asia tibet and mongolian gobi altay and 4 landscape development quantifying sediment production or erosion rates and processes and application of exposure dating to landslides in hong kong publisher s website

this book describes the entire coast and beaches and barrier systems of australia it covers the coastal processes and systems that form and impact australia s 30 000 km coast 12 000 beaches and 2750 barrier systems these processes include geology geomorphology climate waves tides currents sediment supply as well as coastal ecosystems the coast is divided into tropical northern and southern temperate provinces within which are seven divisions 23 regions and 354 coastal sediment compartments each of which is described in detail in the 34 chapters within these systems are the full range of wave through tide dominated beaches and barriers ranging from cheniers to massive transgressive dune systems together with a range of onshore and longshore sand transport systems this is an up to date reference for the entire coast its present condition and likely responses to the impacts of climate change

bering glacier is the largest surging glacier in the world having surged at least six times in the last 150 years with the glacier advancing and retreating as much as 10 km over a surge cycle it is one of the most physically and biologically dynamic places on earth this monograph presents the results of a comprehensive and diverse series of field studies and science investigations at bering glacier the results reported are from a wide range of disciplines including glaciology geology paleogeology hydrology limnology oceanography tectonics geomorphology geophysics meteorology remote sensing climate change anthropology and ecological studies pertaining to vegetation fish and marine mammals the compilation of these individual studies into a single publication allows for a more complete

understanding of how the approximately 5 000 km² bering glacier system plays a major role in the greater southeastern coastal region of alaska and through its wastage its impact on the circulation of the northeast pacific ocean and on the global sea level
