embedded systems now include a very large proportion of the advanced products designed in the world spanning transport avionics space automotive trains electrical and electronic appliances cameras toys televisions home appliances audio systems and cellular phones

process control energy production and distribution factory automation and optimization telecommunications satellites mobile phones and telecom networks and security e commerce smart cards etc the extensive and increasing use of embedded systems and their integration in everyday products marks a significant evolution in information science and technology we expect that within a short timeframe embedded systems will be a part of nearly all equipment designed or manufactured in europe the usa and asia there is now a strategic shift in emphasis for embedded systems designers from simply achieving feasibility to achieving optimality optimal design of embedded systems means targeting a given market segment at the lowest cost and delivery time possible optimality implies seamless integration with the physical and electronic environment while respecting real world constraints such as hard deadlines reliability availability robustness power consumption and cost in our view optimality can only be achieved through the emergence of embedded systems as a discipline in its own right

in status of ngos in international humanitarian law claudie barrat examines the legal framework applicable to ngos in situations of armed conflict the author convincingly demonstrates contrary to convention that in addition to the icrc the national societies and the ifrc numerous other ngos referenced in humanitarian law treaties have a legal status in ihl and therefore legitimate claim to employ ihl provisions to respond to current challenges on the basis of clear and thorough definitions of these entities barrat argues that existing ngos meeting stringent definition can benefit from customary rights and obligations in both international and non international armed conflict

this paper uses a life cycle framework to document new stylized facts about the nexus between job polarization and earnings inequality using quarterly labor force data for the uk over the period 2000 2018 we find clear life cycle profiles in the probability of being employed within each occupation type and wages earned therein cohort plots and econometric analysis suggest that labor market outcomes and prospects have gradually worsened for the young these adverse trends are particularly significant for low skill women estimated cohort effects point to a fall in wages within each occupation as well as a lower propensity of being employed in abstract task occupations we also find evidence of general occupational downgrading in the uk with more educated workers taking up fewer high skill occupations than they did in the past our analysis informs the policy debate over appropriate measures needed to reduce skill mismatches and alleviate labor market transitions
