a text for a first graduate course in real analysis for students in pure and applied mathematics  
statistics education engineering and economics

**Real Analysis 2000-08-15**

this is a course in real analysis directed at advanced undergraduates and beginning graduate  
students in mathematics and related fields presupposing only a modest background in real analysis  
or advanced calculus the book offers something to specialists and non specialists the course  
consists of three major topics metric and normed linear spaces function spaces and lebesgue  
measure and integration on the line in an informal style the author gives motivation and overview  
of new ideas while supplying full details and proofs he includes historical commentary recommends  
articles for specialists and non specialists and provides exercises and suggestions for further  
study this text for a first graduate course in real analysis was written to accommodate the  
heterogeneous audiences found at the masters level students interested in pure and applied  
mathematics statistics education engineering and economics

basic real analysis demonstrates the richness of real analysis giving students an introduction  
both to mathematical rigor and to the deep theorems and counter examples that arise from such  
rigor in this modern and systematic text all the touchstone results and fundamentals are  
carefully presented in a style that requires little prior familiarity with proofs or mathematical  
language with its many examples exercises and broad view of analysis this work is ideal for  
senior undergraduates and beginning graduate students either in the classroom or for self study

introductory analysis an inquiry approach aims to provide a self contained inquiry oriented  
approach to undergraduate level real analysis the presentation of the material in the book is  
intended to be inquiry oriented in that as each major topic is discussed details of the proofs  
are left to the student in a way that encourages an active approach to learning the book is self  
contained in two major ways it includes scaffolding i e brief guiding prompts marked as key steps  
in the proof for many of the theorems second it includes preliminary material that introduces  
students to the fundamental framework of logical reasoning and proof writing techniques students  
will be able to use the guiding prompts and refer to the preliminary work to develop their proof  
writing skills features structured in such a way that approximately one week of class can be  
devoted to each chapter suitable as a primary text for undergraduates or as a supplementary text  
for some postgraduate courses strikes a unique balance between enquiry based learning and more  
traditional approaches to teaching
