the structured query language sql has emerged in recent years as the standard query language used with relational databases the sql language has gained ansi american national standards institute and iso international standards organisation certification and a version of sql is available for almost any computer system from a cray supercomputer to a pc there is now a growing need for a clear basic introduction to sql and its applications the author sets the scene with an introduction to relational databases and a brief history of the development of sql the language is then presented in an overview chapter which describes the functions of the major sql commands and gives the reader an idea of the power of the language in creating populating querying and modifying database tables later chapters focus on explaining each of the sql command groups more fully the order of topics is carefully chosen as many sql commands build upon others

on a snowy st petersburg street in 1903 nikolai gumilev already a budding poet met and fell in love with the fourteen year old anna gorenko akhmatova in that moment she would take her place at the center of gumilev s emotional life and his poetic world despite the painful ruptures between the two over the next eighteen years she would remain there until his abrupt and violent death in 1921 at the age of thirty three swan songs akhmatova and gumilev is the compelling and tragic story of these two great russian poets one well known in the west the other quite unknown it is told through their biographies letters journals memoirs and especially the poems that akhmatova and gumilev wrote to and about one another these poems newly translated by the author and set in the context of their lives provide the key to unlocking the secrets of this passionate turbulent and often painful relationship that akhmatova herself called a terrifying and burning love this book will follow the two poets through their childhood and student days in tsarskoe selo and gumilev s years of persistent wooing of anna that finally ended with their marriage in the silver age of russian poetry akhmatova and gumilev would play leading roles in the lively literary world of st petersburg even as their marriage was coming unraveled these frenetically creative days soon darkened with the coming of the great war and gumilev joined the russian army as a cavalry officer after too many betrayals on both sides akhmatova and gumilev were divorced and re married but both suffered the terrible privations of wartime after the bolshevik revolution gumilev attempted to make a place for himself in a new literary landscape teaching and lecturing akhmatova soon realized that her voice would no longer be heard in this brave new world in august 1921 gumilev was suddenly arrested accused of being part of a conspiracy and shot akhmatova was devastated and spent the rest of her life coming to terms with this loss her attempt to redeem this most important relationship in her life culminated in her last great work poem without a hero the author of swan songs in a new and original reading demonstrates how the deeply encoded figure of nikolai gumilev appears in four layers of the poem and that he is in fact the absent hero

learn sql structured query language from installation to database management and database administration anything that stores data records is called a database it can be a file cd hard disk or any number of storage solutions from a programming point of view a database is a methodically structured repository of indexed data information that can be easily accessed by the users for creating retrieving updating and deleting information data can be stored in many forms most applications require a database for storing information a database can be of two types 1 flat database and 2 relational database as the name suggests a flat database has a two dimensional structure that has data fields and records stored in one large table it is not capable of storing complex information which creates a need for relational databases a relational database stores data in several tables that are related to each other let s take the example of a school a school will have to maintain data for several students to find information for a student we will first ask the class name after the class name we will ask for the first name however if there are two children with the same first name then we will ask for the surname if there are two children will identical names we can still discriminate the information related to them based on their student id parents name date of birth siblings in the same school etc this is all related information when all of this information is stored on paper it takes a lot of time to retrieve it the relational database allows easy access to all of this information sql is a computer language we can use to work with the various database management systems it is the standard language for the various relational database management systems such as oracle mysql ms access sql server postgres sybase etc with the use of sql a database user can create various database objects and perform various manipulations on them when they have accomplished the tasks they were using the objects for the users can drop these database objects a good example of a database object is a table which is a combination of rows and columns tables allow us to group our data into rows and columns sql allows you to create a table insert data into it manipulate this data and even drop it when you are done with its use besides this sql allows you to impose constraints on the table to restrict the data that can be inserted into that table you must have data you need to store well the data should be safeguarded against loss if the data is sensitive you need to safeguard it so it doesn t land into the wrong hands you also need a way of organizing this data so it becomes easy for you to retrieve it you only need to get a
