Scale and Geographic Inquiry 2019-04-22 geography is not what we have assumed it we have conceived it and we have perceived it but it is that what we have not imagined it it is around us it is a system in itself because human behaviour becomes rational when it acts individually but is becomes rational when it operates upon in a collective form therefore it is very difficult to understand man and his behaviour in a given situation so it is incredible to argue about the discipline its past history and the methodological contents it is a misconceived notion of set boundary and a goal of its own in a multidimensional facets of the changing world complexes in which we are living geography in its manifestations begins with the land scape evolution physical basis interacts with the phenomena culminating in human relationships cultural land scape of conceptual world of real and abstract interactions and processes conditions and relations of multivariate facets of elements geographers are thus drawn to the illusion with perplex mind of geographical images this perception has drawn geography and geographers both into a state of unending dilemma of academic jargon of puzzles i e whether it is founded on systems theory or simply an irrelevant distraction science provides us very sharp tools but any craftsman will tell you it is the sharp tool which can do most damage or harm when misapplied it is apparently observed that geographers are badly operationalised with their blunted tools the present attempt is thus to discuss all those problems arises due to multidimensional approaches of the past present analysis and future science literacy methodologies more particularly in the system benchmarks for analogy of systems theory general systems and the science literacy
