this book is currently the only one on this subject containing both introductory material and advanced recent research results it presents at one end fundamental concepts and notations developed in syntactic and structural pattern recognition and at the other reports on the current state of the art with respect to both methodology and applications in particular it includes artificial intelligence related techniques which are likely to become very important in future pattern recognition the book consists of individual chapters written by different authors the chapters are grouped into broader subject areas like syntactic representation and parsing structural representation and matching learning etc each chapter is a self contained presentation of one particular topic in order to keep the original flavor of each contribution no efforts were undertaken to unify the different chapters with respect to notation naturally the self containedness of the individual chapters results in some redundancy however we believe that this handicap is compensated by the fact that each contribution can be read individually without prior study of the preceding chapters a unification of the spectrum of material covered by the individual chapters is provided by the subject and author index included at the end of the book

mathematics as a science of patterns is the definitive exposition of a system of ideas about the nature of mathematics which michael resnik has been elaborating for a number of years in calling mathematics a science he implies that it has a factual subject matter and that mathematical knowledge is on a par with other scientific knowledge in calling it a science of patterns he expresses his commitment to a structuralist philosophy of mathematics he links this to a defence of realism about the metaphysics of mathematics the view that mathematics is about things that really exist resnik s distinctive philosophy of mathematics is here presented in an accessible and systematic form it will be of value not only to specialists in this area but to philosophers mathematicians and logicians interested in the relationship between these three disciplines or in truth realism and epistemology

the main objective of this 2002 book is to show that behind the bewildering diversity of historical speculative episodes it is possible to find hidden regularities thus preparing the way for a unified theory of market speculation speculative bubbles require the study of various episodes in order for a comparative perspective to be obtained and the analysis developed in this book follows a few simple but unconventional ideas investors are assumed to exhibit the same basic behavior during speculative episodes whether they trade stocks real estate or postage stamps the author demonstrates how some of the basic

concepts of dynamical system theory such as the notions of impulse response reaction times and frequency analysis play an instrumental role in describing and predicting speculative behavior this book will serve as a useful introduction for students of econophysics and readers with a general interest in economics as seen from the perspective of physics
